FORMULA INDEX OF ORGANIC COMPOUNDS

Numbers refer to compounds in the preceding table Physical Constants of Organic Compounds.

The arrangement of symbols in formulas is alphabetical except that C always comes first followed immediately by H if hydrogen is present. The arrangement of formulas is also alphabetical except that the number of atoms of any specific kind influences the order of compounds.

The numbers following any one formula are given in numerical order which is also their occurrence in the table of physical constants.

Note: the letter **S** preceding any compound number indicates that it is to be found in the **Supplement** to the table Physical Constants of Organic Compounds.

MELTING POINT INDEX OF ORGANIC COMPOUNDS

The following table lists the melting points of organic compounds in ascending order of temperature in degrees Centigrade. The compounds are identified by the numbers as given in the table Physical Constants of Organic Compounds.

The letter **S** preceding any compound number indicates that it is to be found in the **Supplement** to the table.

Melting points will be quoted as they occur in this table. The order of compounds listed with the same melting point is not significant and will be arbitrarily given in the order of the compound numbers. Owing to lack of agreement in values reported by various observers more than one value is sometimes given or the melting point is indicated by a temperature range. In such cases the position in the list is determined by the lower temperature of the stated range or by the *first* of two stated values, the second value being given in parentheses. Where the values are separated by more than 5° C the melting points are listed separately.

Melting points are given in bold face followed by the numbers of the compounds.

Abbreviations: a = anhydrous; h = hydrate.

BOILING POINT INDEX OF ORGANIC COMPOUNDS

The following table lists the boiling points of organic compounds in ascending order of temperature in degrees Centigrade. The compounds are identified by the numbers as given in the table Physical Constants of Organic Compounds.

The letter **S** preceding any compound number indicates that it is to be found in the **Supplement** to the table.

Boiling points will be quoted as they occur in this table. Only boiling points at or near atmospheric pressure will be listed. The order of compounds listed with the same boiling point is not significant and will be arbitrarily given in the order of the compound numbers. Owing to lack of agreement in values reported by various observers more than one value is sometimes given or the boiling point is indicated by a temperature range. In such cases the position in the list is determined by the lower temperature of the stated range or by the *first* of two stated values, the second value being given in parentheses. Where the values are separated by more than 5° C the boiling points are listed separately.

Boiling points are given in bold face followed by the numbers of the compounds.

PHYSICAL CONSTANTS OF INDUSTRIAL ORGANIC COMPOUNDS

The following table is intended to provide information concerning the characteristics and properties of commercially available organic compounds. The material presented has been compiled from information furnished by the manufacturers whose courtesy is gratefully acknowledged. Where the same compound has been reported by two or more manufacturers separate entries have been made.

PHYSICAL CONSTANTS OF MINERALS

The following table presents data for about 350 of the more common minerals

In order to avoid duplication and save space, very few cross references are given in the body of the table. If the name sought is not found in the table, consult the **synonym index** given below.

Specific gravities are given at normal atmospheric temperatures, a more precise statement being valueless considering the large variations in natural minerals.

Hardness is given in terms of Moh's scale. (See under Hardness.)

Indices of refraction for the sodium line, $\lambda = 5893 \text{ \AA}$, unless otherwise indicated. Li, $\lambda = 6708 \text{ \AA}$. Indices will invariably be given in the order ω , ϵ or α , β , γ . Uniaxial crystals are considered positive if $\epsilon > \omega$, negative if $\omega > \epsilon$. Biaxial crystals are considered positive if β is nearer α in value than it is γ and negative if β is nearer γ than α .

2 In general for all plastics, dielectric strength is a function of the thickness. For polystyrene in particular: Instantaneous Dielectric Strength—0.005 in. thick - 3500v./mil, 0.015 in. thick = 2200 v./mil; 0.125 in. thick = 500-700 v./mil. Complete information concerning thicknesses tested is not available for other plastics.

PHYSICAL PROPERTIES OF NATURAL AND SYNTHETIC RUBBER STOCKS

Compiled by I. B. Prettyman

This table was compiled, for the most part, from the literature. Every effort has been made to give values for stocks of comparable formulation and vulcanization for any one property. It was manifestly impossible to do so between properties. Furthermore, the polymers themselves varied in the proportions of base materials and in the methods of preparation, often in an undisclosed manner. Finally, it is to be realized that changes are constantly being made, both in the polymers and in the stock formulations, and that often variations may be effected for the purpose of enhancing one or more of the specific properties, as desired.

PHYSICAL PROPERTIES OF PIGMENTS (Continued)

¹Abbreviations: art. = artificial; med. = medium; nat. = natural. The chemical formulas are those commonly accepted in chemical and mineralogical literature, but they may not compare exactly with structural formulas based on X-ray diffraction data or even on critical chemical analysis.

²The figures for specific gravity of the artificial pigments are mainly from H. A. Gardner, and those on the mineral pigments are chiefly from E. S. Larsen and H. Berman.

³Symmetry terms (monoclinic, orthorhombic, etc.) are omitted because pigments are so finely divided that it is rare when observations on crystal symmetry can be made. The term, "spherulitic," as used here means aggregates that tend toward radial structure and spherical shape. "Amorphous" describes materials that are microscopically formless but may be truly crystalline on the basis of X-ray diffraction data. Abbreviations: agg. = aggregate(s); amorph. = amorphous; comp. = composite; crypt. = cryptocrystalline; cryst = crystal(s); frag. = fragment(s); glob. = globule(s); irr. = irregular; min. = minute, part = particle(s); prism. = prismatic; round. = rounded; spher. = spheroidal; spherul. = spherulitic; var. = variable; v = very; vitr. = vitreous.

⁴Unless otherwise indicated, all refractive index measurements are by sodium light. Σ is the symbol used by H. E. Merwin to indicate greater or less indefiniteness or irregularity in the case of aggregates, especially in respect to refractive index. Abbreviations: bi = birefringent; c = circa; ext. = extinction; isot. = isotropic; || = parallel; pleo. = pleochroic; s. = strongly; w. = weakly. The letters in brackets refer to the authorities for the refractive index data; M = H. E. Merwin; M* = H. E. Merwin, data by private communication, hitherto unpublished; W = C. D. West, data by private communication, hitherto unpublished; LB = E. S. Larsen and H. Berman; APL = A. P. Laurie and co-authors.

COMMON NAMES OF CHEMICALS, THEIR CORRECT CHEMICAL NAMES AND FORMULÆ

Common Name	Chemical Name	Formula
Acetic ether	Ethyl acetate	$\text{CH}_3\text{CO}_2\text{C}_2\text{H}_5$
Acid of sugar	Oxalic acid	$(\text{CO}_2\text{H})_2$
Aldehyde	Acetaldehyde	CH_3CHO
Alum	Generally refers to potassium aluminum sulfate	$\text{K}_2\text{Al}_2(\text{SO}_4)_4 \cdot 24\text{H}_2\text{O}$
Alum flour		
Alum meal		
Alumina	Aluminum oxide	Al_2O_3
Alumino-ferric	A mixture of aluminum and sodium sulfates	
Alundum	Fused alumina	Al_2O_3
Aniline	Phenyl amine	$\text{C}_6\text{H}_5\text{NH}_2$
Aniline salt	Aniline hydrochloride	$\text{C}_6\text{H}_5\text{NH}_2 \cdot \text{HCl}$
Antichlor	Sodium thiosulfate	$\text{Na}_2\text{S}_2\text{O}_3 \cdot 5\text{H}_2\text{O}$
Antifebrin	Acetanilide	$\text{C}_6\text{H}_5\text{NHCOCH}_3$
Antimony bloom	Antimony trioxide	Sb_2O_3
Antimony black	Antimony trisulfide	Sb_2S_3
Antimony glance		
Antimony red	Antimonous oxysulfide	$\text{Sb}_2\text{S}_3 + \text{Sb}_2\text{O}_3$
Antimony vermilion		
Antimony white	Antimonous oxide	Sb_2O_3
Antimony yellow	Basic lead antimonate	$\text{PbO} \cdot \text{Sb}_2\text{O}_6$
Aqua fortis	Nitric acid	HNO_3
Aqua regia	Nitric acid and hydrochloric acid	$\text{HNO}_3 + 3\text{HCl}$
Argol	Crude potassium acid tartrate	$\text{KHC}_4\text{H}_4\text{O}_6$
Arsenic glass	Arsenous oxide	As_2O_3
Aspirin	Acetyl-salicylic acid	$\text{C}_6\text{H}_4(\text{CO}_2\text{H})(\text{OCOCH}_3)$
Azurite	Basic copper carbonate	$2\text{CuCO}_3 \cdot \text{Cu}(\text{OH})_2$
Bakelite	Resin from phenol + formaldehyde	
Baking soda	Sodium bicarbonate	NaHCO_3
Barium white	Barium sulfate	BaSO_4
Baryta	Barium oxide	BaO
Barytes	Barium sulfate (natural)	BaSO_4
Bauxite	Hydrated alumina	$\text{Al}_2\text{O}_3 \cdot 2\text{H}_2\text{O}$
Beet sugar	Sucrose	$\text{C}_{12}\text{H}_{22}\text{O}_{11}$
Bentonite	Impure aluminum silicate	
Benzine	Gasoline, petrol	
Benzol	Benzene	C_6H_6
Bichrome	Potassium dichromate	$\text{K}_2\text{Cr}_2\text{O}_7$
Bitter salt	Magnesium sulfate	$\text{MgSO}_4 \cdot 7\text{H}_2\text{O}$
Black ash	Impure sodium carbonate	
Blanc-fixe	Barium sulfate (artificial)	BaSO_4
Bleaching powder	Calcium chloro-hypochlorite	CaOCl_2
Blende	Natural zinc sulfide	ZnS

GENERALIZATIONS

(1) Accenting names of chemical substances on the final syllable is to be discouraged in all cases where the preference for such an accent is not emphatic. The names *amine*, *arsine*, *quinone*, and *sulfone* and words ending in these names (also the suffix *-phenone*) represent most of the exceptions. The general trend of the accent in the English language is recognized by authorities to be away from the end and toward the beginning of the word. However, when the last syllable of a word is a significant suffix, as *-al* for aldehydes, it is not slurred by chemists.

(2) In the interest of uniformity and in accordance with a general trend of English pronunciation in America, the ending *-ide* should be pronounced *-īd*. This appears to be uniformly the practice in inorganic chemistry. Many organic names are so pronounced also. Certain organic terms, however, are pronounced *-id* by many, as *acetanilide*, *imide*, *phthalimide*, *lipide*, *amide*, and several words ending in *-amide*.

(3) For chemical names ending in *-ine*, usage is divided between the pronunciations *-ēn* and *-īn*, with a tendency in favor of *-ēn*. Since a distinction in spelling is made by many between names of bases ending in *-ine* and names of nonbases ending in *-in*, the pronunciation *-ēn* for the ending *-ine* is to be encouraged. (It is unfortunate that this conflicts in sound with the pronunciation of the ending *-ene*, but it is believed that this will cause confusion only with a very few words, as benzine and benzene, fluorine and fluorene. As to the pronunciation *-īn*, usage, at least in America, is very strongly against it, and it would conflict with the pronunciation of the new ending *-yne* adopted for names of acetylene hydrocarbons.) Quinine, because of strong popular usage, is an exception.

(4) The pronunciation *-ōl* for the ending of names of alcohols and phenols (except the word alcohol itself!), whether regrettable or not, seems firmly fixed and should be recognized. Emphasis on a significant ending is probably an influence in this practice. Chemical terms not belonging to the above classes, but generally pronounced *-ōl*, should be spelled with a final *e*; examples, *mole*, *pyrrole*. This is in accordance with the recommendation of the International Committee on Organic Nomenclature. For *sol* and words ending in *-sol*, the spelling *-ol* and the pronunciation *-ōl* should be encouraged.

(5) The ending *-yl* should be pronounced *-īl*. The pronunciation *-ēl* is apparently a Germanism and, although still in use

THE PRONUNCIATION OF CHEMICAL WORDS (Continued)

to some extent is to be discouraged. The pronunciation -*il*, apparently common in England, is seldom heard in the United States.

(6) The ending -*ile* (as in nitrile). Usage is divided among the pronunciations -*il*, -*il*, and -*el*. The second of these is identical with the pronunciation recommended for -*yl*, and the third is apparently a Germanism. The pronunciation -*il* should be favored.

(7) The endings -*acic*, -*alic*, -*anic*, -*aric*, -*elic*, *enic*, -*eric*, -*ctic*, -*idic*, -*ilic*, -*inic*, -*isic*, -*onic*, -*opic*, -*oric*. A rather extensive study of the pronunciation of such endings shows a preference for a short vowel preceding -*ic* in all but a few cases. This result is in accord with age-old general English usage and is to be approved. *Acetic* (ă-sē'tik) is a very emphatic exception. Other exceptions are *cetic* (sē'tik) and *ceric* (sēr'ik) and adjectives derived from the names of unsaturated hydrocarbons (because of the influence of the significant -*ene* ending).

(8) The ending -*olic*. This ending is an exception to the rule for words ending in -*ic* [compare (7)], perhaps owing to the influence of words ending in -*ol*. Inasmuch as ten cases out of twelve studied favor the long *ō*, some of them by very large majorities, it is recommended that this ending be uniformly pronounced -*ō'lik*.

(9) Adjectives ending in -*ic* should be accented on the next to the last syllable, as glycer'ic, not gly'ceric. In names of salts the accent, following the trend indicated in (1) above, usually moves one syllable (occasionally more) towards the beginning of the word, as gly'cerate, sal'icylate.

(10) The ending -*ime*. In oxime, at least, this should be pronounced -*ēm*, to accord with usage, though this is contrary to the normal English trend.

(11) The ending -*oin* should be pronounced as two syllables, -*ō-in*, with the accent coming on the preceding syllable (as, bĕn'zō-in, fū'rō-in). In certain words where the addition of a chemical suffix causes two vowels to come together there is a natural tendency to merge them and thus change their sound, as thebaine, linalool. While concession must be made to usage in particular cases, as cocaine, the pronunciation of such vowels separately is to be encouraged. The use of the dieresis is helpful, as linalööl.

(12) Words ending in -*alent* should be so pronounced that the last two syllables are -*vā'lĕnt*; as tri-vā'lĕnt (not triv'ā-lĕnt).

THE WORD LIST

The words listed below are, except for a few deletions, the ones on which the committee's study was based. After each word there is given one or more pronunciations (shown by respelling and the use of symbols as explained at the head of

THE PRONUNCIATION OF CHEMICAL WORDS (Continued)

the list). When only a single pronunciation is shown this means that usage and perhaps other influences are so strongly in favor of it that no alternative is proposed. When more than one pronunciation is shown an attempt has been made to place these in the order of preference. The provision of two, occasionally three, pronunciations indicates that usage is divided without a marked show of preference (this is true of many words throughout the English language), or that there is some conflict between usage and the other influences properly taken into consideration. The word "usage" in parentheses following a pronunciation signifies that usage supports it to a considerable extent, notwithstanding other dictates.

Again let it be said that there is no attempt to proclaim "This pronunciation is right and this one is wrong." Usage, chemical nomenclature considerations, derivation, and the rules of good English (a compromise has sometimes been necessary) suggest certain preferences and these we have tried to ascertain.

KEY TO PRONUNCIATION

The symbols used in the respelling for pronunciation have the following values: *ā*le, senāte, *ām*, *ā*ccount, *ārm*; *ē*ve, *ē*vent, *ē*nd, recēnt, makē; *ice*, *ill*; *ō*ld, *ō*bey, *ō*rb, *ō*dd, cōnnect; *ū*se, *ū*nite, *ū*rn, *ū*p, *circūs*; *fō*od; *oil*; *chair*; *go*; *thin*.

FLAME AND BEAD TESTS

Flame Colorations

VIOLET

Potassium compounds. Purple red through blue glass. Easily obscured by sodium flame. Bluish green through green glass. Rubidium and Caesium compounds impart same flame as potassium compounds.

BLUES

Azure.—Copper chloride. Copper bromide gives azure blue followed by green. Other copper compounds give same coloration when moistened with hydrochloric acid.

Light Blue.—Lead, Arsenic, Selenium.

GREENS

Emerald.—Copper compounds except the halides, and when not moistened with hydrochloric acid.

Pure Green.—Compounds of thallium and tellurium.

Yellowish.—Barium compounds. Some molybdenum compounds. Borates, especially when treated with sulphuric acid or when burned with alcohol.

Bluish.—Phosphates with sulphuric acid.

Feeble.—Antimony compounds. Ammonium compounds.

Whitish.—Zinc.

REDS

Carmine.—Lithium compounds. Violet through blue glass. Invisible through green glass. Masked by barium flame.

Scarlet.—Strontium compounds. Violet through blue glass. Yellowish through green glass. Masked by barium flame.

Yellowish.—Calcium compounds. Greenish through blue glass. Green through green glass. Masked by barium flame.

YELLOW

Yellow.—All sodium compounds. Invisible with blue glass.

PREPARATION OF REAGENTS

The following pages present directions for the preparation of various reagents. The collection has been prepared with the active collaboration of W. D. Bonner, R. K. Carleton, L. L. Carrick, Giles B. Cooke, E. J. Cragoe, Thos. De Vries, James L. Kassner, Thos. W. Mason, F. C. Mathers, M. G. Mellon, W. C. Pierce, J. H. Reedy, Arthur A. Vernon and S. R. Wood. Many others have contributed valuable suggestions.

Volumes have been stated in milliliters (ml) and liters (l). One milliliter is equivalent to 1.000027 cubic centimeters (cm³ or cc.). Masses are indicated in grams (g).

The relation to molar solution (*M*) or normal solution (*N*) is indicated in many cases.

Distilled water should be used.

LABORATORY REAGENTS FOR GENERAL USE

DILUTE ACIDS, 3 molar. Use the amount of concentrated acid indicated and dilute to one liter.

Acetic acid, 3 N. Use 172 ml of 17.4 *M* acid (99–100 %).

Hydrochloric acid, 3 N. Use 258 ml of 11.6 *M* acid (36 % HCl).

Nitric acid, 3 N. Use 195 ml of 15.4 *M* acid (69 % HNO₃).

Phosphoric acid, 9 N. Use 205 ml of 14.6 *M* acid (85 % H₃PO₄).

Sulfuric acid, 6 N. Use 168 ml of 17.8 *M* acid (95 % H₂SO₄).

DILUTE BASES.

Ammonium hydroxide, 3 M, 3 N. Dilute 200 ml of concentrated solution (14.8 *M*, 28 % NH₃) to 1 liter.

Barium hydroxide, 0.2 M, 0.4 N. Saturated solution, 63 g per liter of Ba(OH)₂·8H₂O. Use some excess, filter off BaCO₃ and protect from CO₂ of the air with soda lime or ascarite in a guard tube.

Calcium hydroxide, 0.02 M, 0.04 N. Saturated solution, 1.5 g per liter of Ca(OH)₂. Use some excess, filter off CaCO₃ and protect from CO₂ of the air.

Potassium hydroxide, 3 M, 3 N. Dissolve 176 g of the sticks (95 %) in water and dilute to 1 liter.

Sodium hydroxide, 3 M, 3 N. Dissolve 126 g of the sticks (95 %) in water and dilute to 1 liter.

GENERAL REAGENTS. (See also *Standard Solutions for Volumetric Analysis*, and *Decinormal Solutions of Salts and Other Reagents*.)

Aluminum chloride, 0.167 M, 0.5 N. Dissolve 22 g of AlCl₃ in 1 liter of water.

LABORATORY REAGENTS (Continued)

Aluminum nitrate, 0.167 *M*, 0.5 *N*. Dissolve 58 g of $\text{Al}(\text{NO}_3)_3 \cdot 7.5\text{H}_2\text{O}$ in 1 liter of water.

Aluminum sulfate, 0.083 *M*, 0.5 *N*. Dissolve 56 g of $\text{Al}_2(\text{SO}_4)_3 \cdot 18\text{H}_2\text{O}$ in 1 liter of water.

Ammonium acetate, 3 *M*, 3 *N*. Dissolve 230 g of $\text{NH}_4\text{C}_2\text{H}_3\text{O}_2$ in water and dilute to 1 liter.

Ammonium carbonate, 1.5 *M*. Dissolve 144 g of the commercial salt (mixture of $(\text{NH}_4)_2\text{CO}_3 \cdot \text{H}_2\text{O}$ and $\text{NH}_4\text{CO}_2\text{NH}_2$) in 500 ml of 3 *N* NH_4OH and dilute to 1 liter.

Ammonium chloride, 3 *M*, 3 *N*. Dissolve 160 g of NH_4Cl in water. Dilute to 1 liter.

Ammonium molybdate.

1. 0.5 *M*, 1 *N*. Mix well 72 g of pure MoO_3 (or 81 g of H_2MoO_4) with 200 ml of water, and add 60 ml of conc. ammonium hydroxide. When solution is complete, filter and pour filtrate, *very slowly* and with *rapid stirring*, into a mixture of 270 ml of conc. HNO_3 and 400 ml of water. Allow to stand over night, filter and dilute to 1 liter.

2. The reagent is prepared as two solutions which are mixed as needed, thus always providing fresh reagent of proper strength and composition. Since ammonium molybdate is an expensive reagent, and since an acid solution of this reagent as usually prepared keeps for only a few days, the method proposed will avoid loss of reagent and provide more certain results for quantitative work.

Solution 1. Dissolve 100 g of ammonium molybdate (C.P. grade) in 400 ml of water and 80 ml of 15 *M* NH_4OH . Filter if necessary, though this seldom has to be done.

Solution 2. Mix 400 ml of 16 *M* nitric acid with 600 ml of water.

For use, mix the calculated amount of solution 1 with twice its volume of solution 2, adding solution 1 to solution 2 slowly, with vigorous stirring. Thus, for amounts of phosphorus up to 20 mg, 10 ml of solution 1 to 20 ml of solution 2 is adequate. Increase amount as needed.

Ammonium nitrate, 1 *M*, 1 *N*. Dissolve 80 g of NH_4NO_3 in 1 liter of water.

Ammonium oxalate, 0.25 *M*, 0.5 *N*. Dissolve 35.5 g of $(\text{NH}_4)_2\text{C}_2\text{O}_4 \cdot \text{H}_2\text{O}$ in water. Dilute to 1 liter.

Ammonium sulfate, 0.25 *M*, 0.5 *N*. Dissolve 33 g of $(\text{NH}_4)_2\text{SO}_4$ in 1 liter of water.

Ammonium sulfide, colorless.

1. 3 *M*. Treat 200 ml of conc. NH_4OH with H_2S until saturated, keeping the solution cold. Add 200 ml of conc. NH_4OH and dilute to 1 liter.

2. 6 *N*. Saturate 6 *N* ammonium hydroxide (40 ml conc. ammonia solution + 60 ml H_2O) with washed H_2S gas. The ammonium hydroxide bottle must be completely full and must be kept surrounded by ice while being saturated (about 48 hours for two liters). The reagent is best preserved in brown, completely filled, glass-stoppered bottles.

LABORATORY REAGENTS (Continued)

Ammonium sulfide, yellow. Treat 150 ml of conc. NH_4OH with H_2S until saturated, keeping the solution cool. Add 250 ml of conc. NH_4OH and 10 g of powdered sulfur. Shake the mixture until the sulfur is dissolved and dilute to 1 liter with water. In the solution the concentration of $(\text{NH}_4)_2\text{S}_2$, $(\text{NH}_4)_2\text{S}$ and NH_4OH are 0.625, 0.4 and 1.5 normal respectively. On standing, the concentration of $(\text{NH}_4)_2\text{S}_2$ increases and that of $(\text{NH}_4)_2\text{S}$ and NH_4OH decreases.

Antimony pentachloride, 0.1 *M*, 0.5 *N*. Dissolve 30 g of SbCl_5 in 1 liter of water.

Antimony trichloride, 0.167 *M*, 0.5 *N*. Dissolve 38 g of SbCl_3 in 1 liter of water.

Aqua regia. Mix 1 part concentrated HNO_3 with 3 parts of concentrated HCl . This formula should include one volume of water if the aqua regia is to be stored for any length of time. Without water, objectionable quantities of chlorine and other gases are evolved.

Barium chloride, 0.25 *M*, 0.5 *N*. Dissolve 61 g of $\text{BaCl}_2 \cdot 2\text{H}_2\text{O}$ in water. Dilute to 1 liter.

Barium hydroxide, saturated solution, 0.1 *M*, about 0.2 *N*. Dissolve 32 g of $\text{Ba}(\text{OH})_2 \cdot 8\text{H}_2\text{O}$ in 1 liter of water.

Barium nitrate, 0.25 *M*, 0.5 *N*. Dissolve 65 g of $\text{Ba}(\text{NO}_3)_2$ in 1 liter of water.

Bismuth chloride, 0.167 *M*, 0.5 *N*. Dissolve 53 g of BiCl_3 in 1 liter of dilute HCl . Use 1 part HCl to 5 parts water.

Bismuth nitrate, 0.083 *M*, 0.25 *N*. Dissolve 40 g of $\text{Bi}(\text{NO}_3)_3 \cdot 5\text{H}_2\text{O}$ in 1 liter of dilute HNO_3 . Use 1 part of HNO_3 to 5 parts of water.

Cadmium chloride, 0.25 *M*, 0.5 *N*. Dissolve 46 g of CdCl_2 in 1 liter of water.

Cadmium nitrate, 0.25 *M*, 0.5 *N*. Dissolve 77 g of $\text{Cd}(\text{NO}_3)_2 \cdot 4\text{H}_2\text{O}$ in 1 liter of water.

Cadmium sulfate, 0.25 *M*, 0.5 *N*. Dissolve 70 g of $\text{CdSO}_4 \cdot 4\text{H}_2\text{O}$ in 1 liter of water.

Calcium chloride, 0.25 *M*, 0.5 *N*. Dissolve 55 g of $\text{CaCl}_2 \cdot 6\text{H}_2\text{O}$ in water. Dilute to 1 liter.

Calcium nitrate, 0.25 *M*, 0.5 *N*. Dissolve 41 g of $\text{Ca}(\text{NO}_3)_2$ in 1 liter of water.

Chloroplatinic acid.

1. 0.0512 *M*, 0.102 *N*. Dissolve 26.53 g of $\text{H}_2\text{PtCl}_6 \cdot 6\text{H}_2\text{O}$ in water. Dilute to 100 ml. Contains 0.100 g Pt per ml.

2. Make a 10 % solution by dissolving 1 g of $\text{H}_2\text{PtCl}_6 \cdot 6\text{H}_2\text{O}$ in 9 ml of water. Shake thoroughly to insure complete mixing. Keep in a dropping bottle.

Chromic chloride, 0.167 *M*, 0.5 *N*. Dissolve 26 g of CrCl_3 in 1 liter of water.

Chromic nitrate, 0.167 *M*, 0.5 *N*. Dissolve 40 g of $\text{Cr}(\text{NO}_3)_3$ in 1 liter of water.

Chromic sulfate, 0.083 *M*, 0.5 *N*. Dissolve 60 g of $\text{Cr}_2(\text{SO}_4)_3 \cdot 18\text{H}_2\text{O}$ in 1 liter of water.

Cobaltous nitrate, 0.25 *M*, 0.5 *N*. Dissolve 73 g of $\text{Co}(\text{NO}_3)_2 \cdot 6\text{H}_2\text{O}$ in 1 liter of water.

LABORATORY REAGENTS (Continued)

Cobaltous sulfate, 0.25 *M*, 0.5 *N*. Dissolve 70 g of $\text{CoSO}_4 \cdot 7\text{H}_2\text{O}$ in 1 liter of water.

Cupric chloride, 0.25 *M*, 0.5 *N*. Dissolve 43 g of $\text{CuCl}_2 \cdot 2\text{H}_2\text{O}$ in 1 liter of water.

Cupric nitrate, 0.25 *M*, 0.5 *N*. Dissolve 74 g of $\text{Cu}(\text{NO}_3)_2 \cdot 6\text{H}_2\text{O}$ in 1 liter of water.

Cupric sulfate, 0.5 *M*, 1 *N*. Dissolve 124.8 g of $\text{CuSO}_4 \cdot 5\text{H}_2\text{O}$ in water to which 5 ml of H_2SO_4 has been added. Dilute to 1 liter.

Ferric chloride, 0.5 *M*, 1.5 *N*. Dissolve 135.2 g of $\text{FeCl}_3 \cdot 6\text{H}_2\text{O}$ in water containing 20 ml of conc. HCl . Dilute to 1 liter.

Ferric nitrate, 0.167 *M*, 0.5 *N*. Dissolve 67 g of $\text{Fe}(\text{NO}_3)_3 \cdot 9\text{H}_2\text{O}$ in 1 liter of water.

Ferric sulfate, 0.25 *M*, 0.5 *N*. Dissolve 140.5 g of $\text{Fe}_2(\text{SO}_4)_3 \cdot 9\text{H}_2\text{O}$ in water containing 100 ml of conc. H_2SO_4 . Dilute to 1 liter.

Ferrous ammonium sulfate, 0.5 *M*, 1 *N*. Dissolve 196 g of $\text{Fe}(\text{NH}_4\text{SO}_4)_2 \cdot 6\text{H}_2\text{O}$ in water containing 10 ml of conc. H_2SO_4 . Dilute to 1 liter. Prepare fresh solutions for best results.

Ferrous sulfate, 0.5 *M*, 1 *N*. Dissolve 139 g of $\text{FeSO}_4 \cdot 7\text{H}_2\text{O}$ in water containing 10 ml of conc. H_2SO_4 . Dilute to 1 liter. Solution does not keep well.

Lead acetate, 0.5 *M*, 1 *N*. Dissolve 190 g of $\text{Pb}(\text{C}_2\text{H}_3\text{O}_2)_2 \cdot 3\text{H}_2\text{O}$ in water. Dilute to 1 liter.

Lead nitrate, 0.25 *M*, 0.5 *N*. Dissolve 83 g of $\text{Pb}(\text{NO}_3)_2$ in 1 liter of water.

Lime water. See *Calcium hydroxide*.

Magnesium chloride, 0.25 *M*, 0.5 *N*. Dissolve 51 g of $\text{MgCl}_2 \cdot 6\text{H}_2\text{O}$ in 1 liter of water.

Magnesium chloride reagent. Dissolve 50 g of $\text{MgCl}_2 \cdot 6\text{H}_2\text{O}$ and 100 g of NH_4Cl in 500 ml of water. Add 10 ml of conc. NH_4OH , allow to stand over night and filter if a precipitate has formed. Make acid to methyl red with dilute HCl . Dilute to 1 liter. Solution contains 0.25 *M* MgCl_2 and 2 *M* NH_4Cl . Solution may also be diluted with 133 ml of conc. NH_4OH and water to make 1 liter. Such a solution will contain 2 *M* NH_4OH .

Magnesium nitrate, 0.25 *M*, 0.5 *N*. Dissolve 64 g of $\text{Mg}(\text{NO}_3)_2 \cdot 6\text{H}_2\text{O}$ in 1 liter of water.

Magnesium sulfate, 0.25 *M*, 0.5 *N*. Dissolve 62 g of $\text{MgSO}_4 \cdot 7\text{H}_2\text{O}$ in 1 liter of water.

Manganous chloride, 0.25 *M*, 0.5 *N*. Dissolve 50 g of $\text{MnCl}_2 \cdot 4\text{H}_2\text{O}$ in 1 liter of water.

Manganous nitrate, 0.25 *M*, 0.5 *N*. Dissolve 72 g of $\text{Mn}(\text{NO}_3)_2 \cdot 6\text{H}_2\text{O}$ in 1 liter of water.

Manganous sulfate, 0.25 *M*, 0.5 *N*. Dissolve 69 g of $\text{MnSO}_4 \cdot 7\text{H}_2\text{O}$ in 1 liter of water.

Mercuric chloride, 0.25 *M*, 0.5 *N*. Dissolve 68 g of HgCl_2 in water. Dilute to 1 liter.

LABORATORY REAGENTS (Continued)

Mercuric nitrate, 0.25 *M*, 0.5 *N*. Dissolve 81 g of $\text{Hg}(\text{NO}_3)_2$ in 1 liter of water.

Mercuric sulfate, 0.25 *M*, 0.5 *N*. Dissolve 74 g of HgSO_4 in 1 liter of water.

Mercurous nitrate. Use 1 part HgNO_3 , 20 parts water and 1 part HNO_3 .

Nickel chloride, 0.25 *M*, 0.5 *N*. Dissolve 59 g of $\text{NiCl}_2 \cdot 6\text{H}_2\text{O}$ in 1 liter of water.

Nickel nitrate, 0.25 *M*, 0.5 *N*. Dissolve 73 g of $\text{Ni}(\text{NO}_3)_2 \cdot 6\text{H}_2\text{O}$ in 1 liter of water.

Nickel sulfate, 0.25 *M*, 0.5 *N*. Dissolve 66 g of $\text{NiSO}_4 \cdot 6\text{H}_2\text{O}$ in 1 liter of water.

Potassium bromide, 0.5 *M*, 0.5 *N*. Dissolve 60 g of KBr in 1 liter of water.

Potassium carbonate, 1.5 *M*, 3 *N*. Dissolve 207 g of K_2CO_3 in 1 liter of water.

Potassium chloride, 0.5 *M*, 0.5 *N*. Dissolve 37 g of KCl in 1 liter of water.

Potassium chromate, 0.25 *M*, 0.5 *N*. Dissolve 49 g of K_2CrO_4 in 1 liter of water.

Potassium cyanide, 0.5 *M*, 0.5 *N*. Dissolve 33 g of KCN in 1 liter of water.

Potassium dichromate, 0.125 *M*. Dissolve 37 g of $\text{K}_2\text{Cr}_2\text{O}_7$ in 1 liter of water.

Potassium ferricyanide, 0.167 *M*, 0.5 *N*. Dissolve 55 g of $\text{K}_3\text{Fe}(\text{CN})_6$ in 1 liter of water.

Potassium ferrocyanide, 0.5 *M*, 2 *N*. Dissolve 211 g of $\text{K}_4\text{Fe}(\text{CN})_6 \cdot 3\text{H}_2\text{O}$ in water. Dilute to 1 liter.

Potassium iodide, 0.5 *M*, 0.5 *N*. Dissolve 83 g of KI in 1 liter of water.

Potassium nitrate, 0.5 *M*, 0.5 *N*. Dissolve 51 g of KNO_3 in 1 liter of water.

Potassium sulfate, 0.25 *M*, 0.5 *N*. Dissolve 44 g of K_2SO_4 in 1 liter of water.

Silver nitrate, 0.5 *M*, 0.5 *N*. Dissolve 85 g of AgNO_3 in water. Dilute to 1 liter.

Sodium acetate, 3 *M*, 3 *N*. Dissolve 408 g of $\text{NaC}_2\text{H}_3\text{O}_2 \cdot 3\text{H}_2\text{O}$ in water. Dilute to 1 liter.

Sodium carbonate, 1.5 *M*, 3 *N*. Dissolve 159 g of Na_2CO_3 , or 430 g of $\text{Na}_2\text{CO}_3 \cdot 10\text{H}_2\text{O}$ in water. Dilute to 1 liter.

Sodium chloride, 0.5 *M*, 0.5 *N*. Dissolve 29 g of NaCl in 1 liter of water.

Sodium cobaltinitrite, 0.08 *M* (reagent for potassium). Dissolve 25 g of NaNO_2 in 75 ml of water, add 2 ml of glacial acetic acid and then 2.5 g of $\text{Co}(\text{NO}_3)_2 \cdot 6\text{H}_2\text{O}$. Allow to stand for several days, filter and dilute to 100 ml. Reagent is somewhat unstable.

Sodium hydrogen phosphate, 0.167 *M*, 0.5 *N*. Dissolve 60 g of $\text{Na}_2\text{HPO}_4 \cdot 12\text{H}_2\text{O}$ in 1 liter of water.

Sodium nitrate, 0.5 *M*, 0.5 *N*. Dissolve 43 g of NaNO_3 in 1 liter of water.

LABORATORY REAGENTS (Continued)

Sodium sulfate, 0.25 *M*, 0.5 *N*. Dissolve 36 g of Na_2SO_4 in 1 liter of water.

Sodium sulfide, 0.5 *M*, 1 *N*. Dissolve 120 g of $\text{Na}_2\text{S} \cdot 9\text{H}_2\text{O}$ in water and dilute to 1 liter. Or, saturate 500 ml of 1 *M* NaOH (21 g of 95% NaOH sticks) with H_2S , keeping the solution cool, and dilute with 500 ml of 1 *M* NaOH .

Stannic chloride, 0.125 *M*, 0.5 *N*. Dissolve 33 g of SnCl_4 in 1 liter of water.

Stannous chloride, 0.5 *M*, 1 *N*. Dissolve 113 g of $\text{SnCl}_2 \cdot 2\text{H}_2\text{O}$ in 170 ml of conc. HCl , using heat if necessary. Dilute with water to 1 liter. Add a few pieces of tin foil. Prepare solution fresh at frequent intervals.

Stannous chloride (for Bettendorf test). Dissolve 113 g of $\text{SnCl}_2 \cdot 2\text{H}_2\text{O}$ in 75 ml of conc. HCl . Add a few pieces of tin foil.

Strontium chloride, 0.25 *M*, 0.5 *N*. Dissolve 67 g of $\text{SrCl}_2 \cdot 6\text{H}_2\text{O}$ in 1 liter of water.

Zinc nitrate, 0.25 *M*, 0.5 *N*. Dissolve 74 g of $\text{Zn}(\text{NO}_3)_2 \cdot 6\text{H}_2\text{O}$ in 1 liter of water.

Zinc sulfate, 0.25 *M*, 0.5 *N*. Dissolve 72 g of $\text{ZnSO}_4 \cdot 7\text{H}_2\text{O}$ in 1 liter of water.

SPECIAL SOLUTIONS AND REAGENTS

Aluminon (qualitative test for aluminum). Aluminon is a trade name for the ammonium salt of aurin tricarboxylic acid. Dissolve 1 g of the salt in 1 liter of distilled water. Shake the solution well to insure thorough mixing.

Bang's reagent (for glucose estimation). Dissolve 100 g of K_2CO_3 , 66 g of KCl and 160 g of KHCO_3 in the order given in about 700 ml of water at 30°C . Add 4.4 g of CuSO_4 and dilute to 1 liter after the CO_2 is evolved. This solution should be shaken only in such a manner as not to allow entry of air. After 24 hours 300 ml are diluted to 1 liter with saturated KCl solution, shaken gently and used after 24 hours; 50 ml equivalent to 10 mg glucose.

Barfoed's reagent (test for glucose). See *Cupric acetate*.

Baudisch's reagent. See *Cupferron*.

Benedict's solution (qualitative reagent for glucose). With the aid of heat, dissolve 173 g of sodium citrate and 100 g of Na_2CO_3 in 800 ml of water. Filter, if necessary, and dilute to 850 ml. Dissolve 17.3 g of $\text{CuSO}_4 \cdot 5\text{H}_2\text{O}$ in 100 ml of water. Pour the latter solution, with constant stirring, into the carbonate-citrate solution, and make up to 1 liter.

Benzidine hydrochloride solution (for sulfate determination). Make a paste of 8 g of benzidine hydrochloride ($\text{C}_{12}\text{H}_8(\text{NH}_2)_2 \cdot 2\text{HCl}$) and 20 ml of water, add 20 ml of HCl (sp. gr. 1.12) and dilute to 1 liter with water. Each ml of this solution is equivalent to 0.00357 g of H_2SO_4 .

Bertrand's reagent (glucose estimation). Consists of the following solutions:

SPECIAL SOLUTIONS AND REAGENTS (Continued)

(a) Dissolve 200 g of Rochelle salts and 150 g of NaOH in sufficient water to make 1 liter of solution.

(b) Dissolve 40 g of CuSO_4 in enough water to make 1 liter of solution.

(c) Dissolve 50 g of $\text{Fe}_2(\text{SO}_4)_3$ and 200 g of H_2SO_4 (sp. gr. 1.84) in sufficient water to make 1 liter of solution.

(d) Dissolve 5 g of KMnO_4 in sufficient water to make 1 liter of solution.

Bial's reagent (for pentose). Dissolve 1 g of orcinol ($\text{CH}_3\cdot\text{C}_6\text{H}_3(\text{OH})_2$) in 500 ml of 30 % HCl to which 30 drops of a 10 % solution of FeCl_3 has been added.

Boutron-Boudet soap solution.

(a) Dissolve 100 g of pure castile soap in about 2500 ml of 56 % ethyl alcohol.

(b) Dissolve 0.59 g of $\text{Ba}(\text{NO}_3)_2$ in 1 liter of water.

Adjust the castile soap solution so that 2.4 ml of it will give a permanent lather with 40 ml of solution (b). When adjusted, 2.4 ml of soap solution is equivalent to 220 parts per million of hardness (as CaCO_3) for a 40 ml sample.

See also *Soap solution*.

Brucke's reagent (protein precipitation). See *Potassium iodide-mercuric iodide*.

Clarke's soap solution (or A.P.H.A. standard method). Estimation of hardness in water.

(a) Dissolve 100 g of pure powdered castile soap in 1 liter of 80 % ethyl alcohol and allow to stand over night.

(b) Prepare a standard solution of CaCl_2 by dissolving 0.5 g of CaCO_3 in HCl (sp. gr. 1.19), neutralize with NH_4OH and make slightly alkaline to litmus, and dilute to 500 ml. One ml is equivalent to 1 mg of CaCO_3 .

Titrate (a) against (b) and dilute (a) with 80 % ethyl alcohol until 1 ml of the resulting solution is equivalent to 1 ml of (b) after making allowance for the lather factor (the amount of standard soap solution required to produce a permanent lather in 50 ml of distilled water). One ml of the adjusted solution after subtracting the lather factor is equivalent to 1 mg of CaCO_3 .

See also *Soap solution*.

Cobalticyanide paper (Rinnmann's test for Zn). Dissolve 4 g of $\text{K}_3\text{Co}(\text{CN})_6$ and 1 g of KClO_3 in 100 ml of water. Soak filter paper in solution and dry at 100°C . Apply drop of zinc solution and burn in an evaporating dish. A green disk is obtained if zinc is present.

Cochineal. Extract 1 g of cochineal for four days with 20 ml of alcohol and 60 ml of distilled water. Filter.

Congo red. Dissolve 0.5 g of congo red in 90 ml of distilled water and 10 ml of alcohol.

Cupferron (Baudisch's reagent for iron analysis). Dissolve 6 g of the ammonium salt of nitroso-phenyl-hydroxylamine (cupferron) in 100 ml of H_2O . Reagent good for one week only and must be kept in the dark.

SPECIAL SOLUTIONS AND REAGENTS (Continued)

Cupric acetate (Barfoed's reagent for reducing monosaccharides). Dissolve 66 g of cupric acetate and 10 ml of glacial acetic acid in water and dilute to 1 liter.

Cupric oxide, ammoniacal; Schweitzer's reagent (dissolves cotton, linen and silk, but not wool).

1. Dissolve 5 g of cupric sulfate in 100 ml of boiling water, and add sodium hydroxide until precipitation is complete. Wash the precipitate well, and dissolve it in a minimum quantity of ammonium hydroxide.

2. Bubble a slow stream of air through 300 ml of strong ammonium hydroxide containing 50 g of fine copper turnings. Continue for one hour.

Cupric sulfate in glycerin-potassium hydroxide (reagent for silk). Dissolve 10 g of cupric sulfate, $\text{CuSO}_4 \cdot 5\text{H}_2\text{O}$, in 100 ml of water and add 5 g of glycerin. Add KOH solution slowly until a deep blue solution is obtained.

Cupron (benzoin oxime). Dissolve 5 g in 100 ml of 95% alcohol.

Cuprous chloride, acidic (reagent for CO in gas analysis).

1. Cover the bottom of a two-liter flask with a layer of cupric oxide about one-half inch deep, suspend a bunch of copper wire so as to reach from the bottom to the top of the solution, and fill the flask with hydrochloric acid (sp. gr. 1.10). Shake occasionally. When the solution becomes nearly colorless, transfer to reagent bottles, which should also contain copper wire. The stock bottle may be refilled with dilute hydrochloric acid until either the cupric oxide or the copper wire is used up.

Copper sulfate may be substituted for copper oxide in the above procedure.

2. Dissolve 340 g of $\text{CuCl}_2 \cdot 2\text{H}_2\text{O}$ in 600 ml of conc. HCl and reduce the cupric chloride by adding 190 ml of a saturated solution of stannous chloride or until the solution is colorless. The stannous chloride is prepared by treating 300 g of metallic tin in a 500 ml flask with conc. HCl until no more tin goes into solution.

3. (Winkler method). Add a mixture of 86 g of CuO and 17 g of finely divided metallic Cu, made by the reduction of CuO with hydrogen, to a solution of HCl, made by diluting 650 ml of conc. HCl with 325 ml of water. After the mixture has been added slowly and with frequent stirring, a spiral of copper wire is suspended in the bottle, reaching all the way to the bottom. Shake occasionally, and when the solution becomes colorless, it is ready for use.

Cuprous chloride, ammoniacal (reagent for CO in gas analysis).

1. The acid solution of cuprous chloride as prepared above is neutralized with ammonium hydroxide until an ammonia odor persists. An excess of metallic copper must be kept in the solution.

2. Pour 800 ml of acidic cuprous chloride, prepared by the Winkler method, into about 4 liters of water. Transfer the

SPECIAL SOLUTIONS AND REAGENTS (Continued)

precipitate to a 250 ml graduate. After several hours, siphon off the liquid above the 50 ml mark and refill with 7.5 % NH_4OH solution which may be prepared by diluting 50 ml of conc. NH_4OH with 150 ml of water. The solution is well shaken and allowed to stand for several hours. It should have a faint odor of ammonia.

Dichlorofluorescein indicator. Dissolve 1 g in 1 liter of 70 % alcohol or 1 g of the sodium salt in 1 liter of water.

Dimethylglyoxime (diacetyl dioxime), 0.01 N. Dissolve 0.6 g of dimethylglyoxime, $(\text{CH}_3\text{CNOH})_2$, in 500 ml of 95 % ethyl alcohol. This is an especially sensitive test for nickel, a very definite crimson color being produced.

Diphenylamine (reagent for rayon). Dissolve 0.2 g in 100 ml of concentrated sulfuric acid.

Diphenylamine sulfonate (for titration of iron with $\text{K}_2\text{Cr}_2\text{O}_7$). Dissolve 0.32 g of the barium salt of diphenylamine sulfonic acid in 100 ml of water, add 0.5 g of sodium sulfate and filter off the precipitate of BaSO_4 .

Diphenylcarbazide. Dissolve 0.2 g of diphenylcarbazide in 10 ml of glacial acetic acid and dilute to 100 ml with 95 % ethyl alcohol.

Esbach's reagent (estimation of protein). To a water solution of 10 g of picric acid and 20 g of citric acid, add sufficient water to make one liter of solution.

Eschka's compound. Two parts of calcined ("light") magnesia are thoroughly mixed with one part of anhydrous sodium carbonate.

Fehling's solution (reagent for reducing sugars).

(a) Copper sulfate solution. Dissolve 34.66 g of $\text{CuSO}_4 \cdot 5\text{H}_2\text{O}$ in water and dilute to 500 ml.

(b) Alkaline tartrate solution. Dissolve 173 g of potassium sodium tartrate (Rochelle salts, $\text{KNaC}_4\text{H}_4\text{O}_6 \cdot 4\text{H}_2\text{O}$) and 50 g of NaOH in water and dilute when cold to 500 ml.

For use, mix equal volumes of the two solutions at the time of using.

Ferric-alum indicator. Dissolve 140 g of ferric-ammonium sulfate crystals in 400 ml of hot water. When cool, filter, and make up to a volume of 500 ml with dilute (6 N) nitric acid.

Folin's mixture (for uric acid). To 650 ml of water add 500 g of $(\text{NH}_4)_2\text{SO}_4$, 5 g of uranium acetate and 6 g of glacial acetic acid. Dilute to 1 liter.

Formaldehyde-sulfuric acid (Marquis' reagent for alkaloids). Add 10 ml of formaldehyde solution to 50 ml of sulfuric acid.

Froehde's reagent. See *Sulfomolybdic acid*.

Fuchsin (reagent for linen). Dissolve 1 g of fuchsin in 100 ml of alcohol.

Fuchsin-sulfurous acid (Schiff's reagent for aldehydes). Dissolve 0.5 g of fuchsin and 9 g of sodium bisulfite in 500 ml of water, and add 10 ml of HCl . Keep in well-stoppered bottles and protect from light.

SPECIAL SOLUTIONS AND REAGENTS (Continued)

Gunzberg's reagent (detection of HCl in gastric juice). Prepare as needed a solution containing 4 g of phloroglucinol and 2 g of vanillin in 100 ml of absolute ethyl alcohol.

Hager's reagent. See *Picric acid*.

Hanus solution (for iodine number). Dissolve 13.2 g of resublimed iodine in one liter of glacial acetic acid which will pass the dichromate test for reducible matter. Add sufficient bromine to double the halogen content, determined by titration (3 ml is about the proper amount). The iodine may be dissolved by the aid of heat, but the solution should be cold when the bromine is added.

Iodine, tincture of. To 50 ml of water add 70 g of I_2 and 50 g of KI. Dilute to 1 liter with alcohol.

Iodo-potassium iodide (Wagner's reagent for alkaloids). Dissolve 2 g of iodine and 6 g of KI in 100 ml of water.

Litmus (indicator). Extract litmus powder three times with boiling alcohol, each treatment consuming an hour. Reject the alcoholic extract. Treat residue with an equal weight of cold water and filter; then exhaust with five times its weight of boiling water, cool and filter. Combine the aqueous extracts.

Magnesia mixture (reagent for phosphates and arsenates). Dissolve 55 g of magnesium chloride and 105 g of ammonium chloride in water, barely acidify with hydrochloric acid, and dilute to 1 liter. The ammonium hydroxide may be omitted until just previous to use. The reagent, if completely mixed and stored for any period of time, becomes turbid.

Magnesium reagent. See *S and O reagent*.

Magnesium uranyl acetate. Dissolve 100 g of $UO_2 \cdot (C_2H_3O_2)_2 \cdot 2H_2O$ in 60 ml of glacial acetic acid and dilute to 500 ml. Dissolve 330 g of $Mg(C_2H_3O_2)_2 \cdot 4H_2O$ in 60 ml of glacial acetic acid and dilute to 200 ml. Heat solutions to the boiling point until clear, pour the magnesium solution into the uranyl solution, cool and dilute to 1 liter. Let stand over night and filter if necessary.

Marme's reagent. See *Potassium-cadmium iodide*.

Marquis' reagent. See *Formaldehyde-sulfuric acid*.

Mayer's reagent (white precipitate with most alkaloids in slightly acid solutions). Dissolve 1.358 g of $HgCl_2$ in 60 ml of water and pour into a solution of 5 g of KI in 10 ml of H_2O . Add sufficient water to make 100 ml.

Methyl orange indicator. Dissolve 1 g of methyl orange in 1 liter of water. Filter, if necessary.

Methyl orange, modified. Dissolve 2 g of methyl orange and 2.8 g of xylene cyanole FF in 1 liter of 50 % alcohol.

Methyl red indicator. Dissolve 1 g of methyl red in 600 ml of alcohol and dilute with 400 ml of water.

Methyl red, modified. Dissolve 0.50 g of methyl red and 1.25 g of xylene cyanole FF in 1 liter of 90 % alcohol. Or, dissolve 1.25 g of methyl red and 0.825 g of methylene blue in 1 liter of 90 % alcohol.

SPECIAL SOLUTIONS AND REAGENTS (Continued)

Millon's reagent (for albumins and phenols). Dissolve 1 part of mercury in 1 part of cold fuming nitric acid. Dilute with twice the volume of water and decant the clear solution after several hours.

Mixed indicator. Prepared by adding about 1.4 g of xylene cyanole FF to 1 g of methyl orange. The dye is seldom pure enough for these proportions to be satisfactory. Each new lot of dye should be tested by adding additional amounts of the dye until a test portion gives the proper color change. The acid color of this indicator is like that of permanganate; the neutral color is gray; and the alkaline color is green. Described by Hickman and Linstead, J. Chem. Soc. (Lon.), **121**, 2502 (1922).

Molisch's reagent. See α -Naphthol.

α -Naphthol (Molisch's reagent for wool). Dissolve 15 g of α -naphthol in 100 ml of alcohol or chloroform.

Nessler's reagent (for ammonia). Dissolve 50 g of KI in the smallest possible quantity of cold water (50 ml). Add a saturated solution of mercuric chloride (about 22 g in 350 ml of water will be needed) until an excess is indicated by the formation of a precipitate. Then add 200 ml of 5 N NaOH and dilute to 1 liter. Let settle, and draw off the clear liquid.

Nickel oxide, ammoniacal (reagent for silk). Dissolve 5 g of nickel sulfate in 100 ml of water, and add sodium hydroxide solution until nickel hydroxide is completely precipitated. Wash the precipitate well and dissolve in 25 ml of concentrated ammonium hydroxide and 25 ml of water.

p-Nitrobenzene-azo-resorcinol (reagent for magnesium). Dissolve 1 g of the dye in 10 ml of N NaOH and dilute to 1 liter.

Nitron (detection of nitrate radical). Dissolve 10 g of nitron ($C_{20}H_{16}N_4$, 4, 5-dihydro-1, 4-diphenyl-3, 5-phenylimino-1, 2, 4-triazole) in 5 ml of glacial acetic acid and 95 ml of water. The solution may be filtered with slight suction through an alundum crucible and kept in a dark bottle.

α -Nitroso- β -naphthol. Make a saturated solution in 50 % acetic acid (1 part of glacial acetic acid with 1 part of water). Does not keep well.

Nylander's solution (carbohydrates). Dissolve 20 g of bismuth subnitrate and 40 g of Rochelle salts in 1 liter of 8 % NaOH solution. Cool and filter.

Obermayer's reagent (for indoxyl in urine). Dissolve 4 g of $FeCl_3$ in one liter of HCl (sp. gr. 1.19).

Oxine. Dissolve 14 g of HC_9H_6ON in 30 ml of glacial acetic acid. Warm slightly, if necessary. Dilute to 1 liter.

Oxygen absorbent. Dissolve 300 g of ammonium chloride in one liter of water and add one liter of concentrated ammonium hydroxide solution. Shake the solution thoroughly. For use as an oxygen absorbent, a bottle half full of copper turnings is filled nearly full with the NH_4Cl - NH_4OH solution and the gas passed through.

Pasteur's salt solution. To one liter of distilled water add 2.5 g of potassium phosphate, 0.25 g of calcium phosphate, 0.25 g of magnesium sulfate and 12.00 g of ammonium tartrate.

SPECIAL SOLUTIONS AND REAGENTS (Continued)

Pavy's solution (glucose reagent). To 120 ml of Fehling's solution, add 300 ml of NH_4OH (sp. gr. 0.88) and dilute to 1 liter with water.

Phenanthroline ferrous ion indicator. Dissolve 1.485 g of phenanthroline monohydrate in 100 ml of 0.025 *M* ferrous sulfate solution.

Phenolphthalein. Dissolve 1 g of phenolphthalein in 50 ml of alcohol and add 50 ml of water.

Phenolsulfonic acid (determination of nitrogen as nitrate). Dissolve 25 g of phenol in 150 ml of conc. H_2SO_4 , add 75 ml of fuming H_2SO_4 (15% SO_3), stir well and heat for two hours at 100° C.

Phloroglucinol solution (pentosans). Make a 3% phloroglucinol solution in alcohol. Keep in a dark bottle.

Phosphomolybdic acid (Sonnenschein's reagent for alkaloids).

1. Prepare ammonium phosphomolybdate and after washing with water, boil with nitric acid and expel NH_3 ; evaporate to dryness and dissolve in 2 *N* nitric acid.

2. Dissolve ammonium molybdate in HNO_3 and treat with phosphoric acid. Filter, wash the precipitate, and boil with aqua regia until the ammonium salt is decomposed. Evaporate to dryness. The residue dissolved in 10% HNO_3 constitutes Sonnenschein's reagent.

Phosphoric acid—sulfuric acid mixture. Dilute 150 ml of conc. H_2SO_4 and 100 ml of conc. H_3PO_4 (85%) with water to a volume of 1 liter.

Phosphotungstic acid (Scheibler's reagent for alkaloids).

1. Dissolve 20 g of sodium tungstate and 15 g of sodium phosphate in 100 ml of water containing a little nitric acid.

2. The reagent is a 10% solution of phosphotungstic acid in water. The phosphotungstic acid is prepared by evaporating a mixture of 10 g of sodium tungstate dissolved in 5 g of phosphoric acid (sp. gr. 1.13) and enough boiling water to effect solution. Crystals of phosphotungstic acid separate.

Picric acid (Hager's reagent for alkaloids, wool and silk). Dissolve 1 g of picric acid in 100 ml of water.

Potassium antimonate (reagent for sodium). Boil 22 g of potassium antimonate with 1 liter of water until nearly all of the salt has dissolved, cool quickly, and add 35 ml of 10% potassium hydroxide. Filter after standing over night.

Potassium-cadmium iodide (Marme's reagent for alkaloids). Add 2 g of CdI_2 to a boiling solution of 4 g of KI in 12 ml of water, and then mix with 12 ml of saturated KI solution.

Potassium hydroxide (for CO_2 absorption). Dissolve 360 g of KOH in water and dilute to 1 liter.

Potassium iodide-mercuric iodide (Brucke's reagent for proteins). Dissolve 50 g of KI in 500 ml of water, and saturate with mercuric iodide (about 120 g). Dilute to 1 liter.

SPECIAL SOLUTIONS AND REAGENTS (Continued)

Potassium pyrogallate (for oxygen absorption). For mixtures of gases containing less than 28% oxygen, add 100 ml of KOH solution (50 g of KOH to 100 ml of water) to 5 g of pyrogallol. For mixtures containing more than 28% oxygen the KOH solution should contain 120 g of KOH to 100 ml of water.

Pyrogallol, alkaline.

(a) Dissolve 75 g of pyrogallie acid in 75 ml of water.

(b) Dissolve 500 g of KOH in 250 ml of water. When cool, adjust until sp. gr. is 1.55.

For use, add 270 ml of solution (b) to 30 ml of solution (a).

Rosolic acid (indicator). Dissolve 1 g of rosolic acid in 10 ml of alcohol and add 100 ml of water.

S and O reagent (Suitsu and Okuma's test for Mg). Dissolve 0.5 g of the dye (*o-p*-dihydroxy-monazo-*p*-nitrobenzene) in 100 ml of 0.25 *N* NaOH.

Scheibler's reagent. See *Phosphotungstic acid*.

Schiff's reagent. See *Fuchsin-sulfurous acid*.

Schweltzer's reagent. See *Cupric oxide, ammoniacal*.

Soap solution (reagent for hardness in water). Dissolve 100 g of dry castile soap in 1 liter of 80% alcohol (5 parts alcohol to 1 part water). Allow to stand several days and dilute with 70% to 80% alcohol until 6.4 ml produces a permanent lather with 20 ml of standard calcium solution. The latter solution is made by dissolving 0.2 g of CaCO₃ in a small amount of dilute HCl, evaporating to dryness and making up to 1 liter.

Sodium bismuthate (oxidation of manganese). Heat 20 parts of NaOH nearly to redness in an iron or nickel crucible and add slowly 10 parts of basic bismuth nitrate which has been previously dried. Add two parts of sodium peroxide, and pour the brownish-yellow fused mass on an iron plate to cool. When cold, break up in a mortar, extract with water, and collect on an asbestos filter.

Sodium hydroxide (for CO₂ absorption). Dissolve 330 g of NaOH in water and dilute to 1 liter.

Sodium nitroprusside (reagent for hydrogen sulfide and wool). Use a freshly prepared solution of 1 g of sodium nitroprusside in 10 ml of water.

Sodium oxalate, according to Sørensen (primary standard). Dissolve 30 g of the commercial salt in 1 liter of water, make slightly alkaline with sodium hydroxide, and let stand until perfectly clear. Filter and evaporate the filtrate to 100 ml. Cool and filter. Pulverize the residue and wash it several times with small volumes of water. The procedure is repeated until the mother liquor is free from sulfate and is neutral to phenolphthalein.

Sodium plumbite (reagent for wool). Dissolve 5 g of sodium hydroxide in 100 ml of water. Add 5 g of litharge and boil until dissolved.

SPECIAL SOLUTIONS AND REAGENTS (Continued)

Sodium polysulfide. Dissolve 480 g of $\text{Na}_2\text{S} \cdot 9\text{H}_2\text{O}$ in 500 ml of water, add 40 g of NaOH and 18 g of sulfur. Stir thoroughly and dilute to 1 liter with water.

Sonnenschein's reagent. See *Phosphomolybdic acid*.

Starch solution.

1. Make a paste with 2 g of soluble starch and 0.01 g of HgI_2 with a small amount of water. Add the mixture slowly to 1 liter of boiling water and boil for a few minutes. Keep in a glass stoppered bottle. If other than soluble starch is used, the solution will not clear on boiling; it should be allowed to stand and the clear liquid decanted.

2. A solution of starch which keeps indefinitely is made as follows: Mix 500 ml of saturated NaCl solution (filtered), 80 ml of glacial acetic acid, 20 ml of water and 3 g of starch. Bring slowly to a boil and boil for two minutes.

3. Make a paste with 1 g of soluble starch and 5 mg of HgI_2 , using as little cold water as possible. Then pour about 200 ml of boiling water on the paste and stir immediately. This will give a clear solution if the paste is prepared correctly and the water actually boiling. Cool and add 4 g of KI . Starch solution decomposes on standing due to bacterial action, but this solution will keep a long time if stored under a layer of toluene.

Stoke's reagent. Dissolve 30 g of FeSO_4 and 20 g of tartaric acid in water and dilute to 1 liter. Just before using, add concentrated NH_4OH until the precipitate first formed is redissolved.

Sulfanilic acid (reagent for nitrites). Dissolve 0.5 g of sulfanilic acid in a mixture of 15 ml of glacial acetic acid and 135 ml of recently boiled water.

Sulfomolybdic acid (Froehde's reagent for alkaloids and glucosides). Dissolve 10 g of molybdic acid or sodium molybdate in 100 ml of conc. H_2SO_4 .

Tannic acid (reagent for albumen, alkaloids and gelatin). Dissolve 10 g of tannic acid in 10 ml of alcohol and dilute with water to 100 ml.

Titration mixture. See *Zimmermann-Reinhardt reagent*.

***o*-Tolidine solution** (residual chlorine in water analysis). Prepare 1 liter of dilute HCl (100 ml of HCl (sp. gr. 1.19) in sufficient water to make 1 liter). Dissolve 1 g of *o*-tolidine in 100 ml of the dilute HCl and dilute to 1 liter with dilute HCl solution.

Trinitrophenol solution. See *Picric acid*.

Turmeric paper. Impregnate white, unsized paper with the tincture, and dry.

Turmeric tincture (reagent for borates). Digest ground turmeric root with several quantities of water which are discarded. Dry the residue and digest it several days with six times its weight of alcohol. Filter.

Uffelmann's reagent (turns yellow in presence of a lactic acid). To a 2% solution of pure phenol in water, add a water solution of FeCl_3 until the phenol solution becomes violet in color.

SPECIAL SOLUTIONS AND REAGENTS (Continued)

Wagner's reagent. See *Iodo-potassium iodide*.

Wagner's solution (used in phosphate rock analysis to prevent precipitation of iron and aluminum). Dissolve 25 g of citric acid and 1 g of salicylic acid in water and dilute to 1 liter. Use 50 ml of the reagent.

Wij's iodine monochloride solution (for iodine number). Dissolve 13 g of resublimed iodine in 1 liter of glacial acetic acid which will pass the dichromate test for reducible matter. Set aside 25 ml of this solution. Pass into the remainder of the solution dry chlorine gas (dried and washed by passing through H_2SO_4 (sp. gr. 1.84)) until the characteristic color of free iodine has been discharged. Now add the iodine solution which was reserved, until all free chlorine has been destroyed. A slight excess of iodine does little or no harm, but an excess of chlorine must be avoided. Preserve in well stoppered, amber colored bottles. Avoid use of solutions which have been prepared for more than 30 days.

Wij's special solution (for iodine number—Analyst 58, 523-7, 1933). To 200 ml of glacial acetic acid that will pass the dichromate test for reducible matter, add 12 g of dichloroamine T (paratoluene-sulfonatedichloroamide), and 16.6 g of dry KI (in small quantities with continual shaking until all the KI has dissolved). Make up to 1 liter with the same quality of acetic acid used above and preserve in a dark colored bottle.

Zimmermann-Reinhardt reagent (determination of iron). Dissolve 70 g of $\text{MnSO}_4 \cdot 4\text{H}_2\text{O}$ in 500 ml of water, add 125 ml of conc. H_2SO_4 and 125 ml of 85 % H_3PO_4 , and dilute to 1 liter.

Zinc chloride solution, basic (reagent for silk). Dissolve 1000 g of zinc chloride in 850 ml of water, and add 40 g of zinc oxide. Heat until solution is complete.

Zinc uranyl acetate (reagent for sodium). Dissolve 10 g of $\text{UO}_2(\text{C}_2\text{H}_3\text{O}_2)_2 \cdot 2\text{H}_2\text{O}$ in 6 g of 30 % acetic acid with heat, if necessary, and dilute to 50 ml. Dissolve 30 g of $\text{Zn}(\text{C}_2\text{H}_3\text{O}_2)_2 \cdot 2\text{H}_2\text{O}$ in 3 g of 30 % acetic acid and dilute to 50 ml. Mix the two solutions, add 50 mg of NaCl, allow to stand over night and filter.

STANDARD SOLUTIONS FOR VOLUMETRIC ANALYSIS

Acids

Hydrochloric acid, normal. (36.465 g per liter) (a) 180.15 g of constant boiling point (760 mm) acid diluted to 1 liter gives an exactly normal solution. (b) Concentrated HCl diluted to d 1.020 is approximately normal. (c) Concentrated HCl contains about one-third of its weight of HCl and 120 g diluted with water to 1 liter will give an acid slightly greater than normal. Solutions prepared as in (b) or (c) are most accurately standardized by precipitation as AgCl.

Hydrochloric acid solutions, standard, by the method of G. A. Hulett and W. D. Bonner. *Jour. Am. Chem. Soc.* **31**, 390 (1909). Standard HCl is easily prepared by starting with HCl of about d 1.10, made up with an ordinary hydrometer, distilling off and discarding the first three-fourths of the liquid taken; the distillate which is then collected does not differ by more than one part in 10,000 from the values in the table below. This constant boiling acid is not hygroscopic or noticeably volatile and is easily weighed in a small flask. By the use of a capillary pipette, to adjust the last amount of acid, it is a very simple matter to weigh out 180.15 g to less than 10 mg and this furnishes sufficient acid to make a liter of normal solution with an accuracy that is seldom attained even with very elaborate precautions.

SOLUTIONS FOR VOLUMETRIC ANALYSIS (Continued)

Nitric acid, normal. (63.016 g per liter) Use a colorless acid, $d\ 1.3 \pm$, free from chlorine and nitrous acid; a yellow color due to lower oxides of nitrogen is removed by adding about 2 volumes of water, boiling, cooling and then diluting to volume. 65 ml or 93 g of acid, $d\ 1.42$ diluted to 1 liter gives an acid slightly greater than normal. Standardize by titration with standard alkali.

Oxalic acid, normal. $H_2C_2O_4$ (63.023 g of $H_2C_2O_4 \cdot 2H_2O$ or 45.008 g of $H_2C_2O_4$ per liter) Because of the uncertainty in the amount of water of crystallization, standards in dry climates cannot be prepared directly by dissolving a weighed quantity of acid. However, in a humid atmosphere finely ground oxalic acid crystals may be exposed to the air for a few hours, and brought to the proper composition. Unless this is done it is necessary to standardize the solution against alkali of known concentration using phenolphthalein as an indicator. Decinormal or less concentrated solutions are unstable and should be prepared fresh when needed; more concentrated solutions may deposit some of the acid when cooled to low temperatures but they are fairly stable at room temperature when protected from light.

Potassium acid phthalate, decinormal. ($KHC_8H_4O_4$, 10.207 g per 500 ml) This monobasic acid is recommended for the preparation of standard acid solutions, since it has a high equivalent weight, is anhydrous, stable, non-hygroscopic, and can be purchased with a purity factor of 99.95 %. Spread 10–11 g of the salt in a thin layer on a watch glass and dry at $110\text{--}120^\circ\text{C}$ in an electric oven for 2–3 hours. Cool in a desiccator and weigh to the nearest milligram. Transfer the salt to a 500 ml volumetric flask, with aid of a funnel, and reweigh the watch glass with any adhering powder. Dissolve the salt in the flask, dilute to volume, and mix thoroughly. Compute the normality of the solution by the equation

$$\text{Normality} = \frac{\text{Weight of salt} \times \text{purity}}{102.07}$$

Potassium acid phthalate is suitable for the titration of carbonate-free strong bases, using phenolphthalein indicator, but is not suitable for titration of ammonium hydroxide.

Succinic acid, decinormal. $H_2C_4H_4O_4$ (5.9023 g per liter) Dry 5–6 g of pure succinic acid in an open weighing bottle at 105° for about 10 hours; cool in a desiccator. Weigh out accurately 2.9512 g, brush into a 400 ml beaker and dissolve in 150–200 ml of water; pour the solution into a 500 ml graduated flask, rinsing out the beaker several times to insure complete transference of the acid. Dilute to exactly 500 ml and mix thoroughly. This prepares an exact decinormal solution.

Sulfuric acid, normal. (49.04 g per liter) Take 30 ml of pure, concentrated H_2SO_4 , $d\ 1.84$ and pour it cautiously and slowly into about 3–4 volumes of water, cool, mix thoroughly and dilute to 1 liter. Standardize by titration with standard

SOLUTIONS FOR VOLUMETRIC ANALYSIS (Continued)

NaOH or KOH solutions with phenolphthalein as indicator. For a decinormal solution use 3 ml H_2SO_4 per liter and proceed as above. Sulfuric acid is obtained easily in a pure form; the normal acid solution is not affected by boiling (advantage over similar HNO_3 or HCl solutions); when used with lime or similar compounds, it gives precipitates and for such cases HCl is preferable.

Bases

For the titration of weak acids, bases should be made free of carbonate and used with phenolphthalein indicator. Such solutions should be stored in siphon-equipped bottles and protected from carbon dioxide by a soda-lime tube on the air inlet. The burette used for the titration should be capped by a one-hole stopper bearing a small tube of soda lime. If a base is to be used only for the titration of strong acids, it is unnecessary to remove carbonate or to protect the solution from carbon dioxide, since absorption of the latter does not change the alkaline value of the solution. Bases containing carbonate should be used with methyl orange indicator.

Potassium hydroxide, normal. (56.108 g per liter) Dissolve 64 g of potassium hydroxide, of assay value 85 % or better, in water and dilute to 1 liter. Standardize as directed for sodium hydroxide.

Sodium hydroxide, decinormal. Carbonate free. Prepare the carbonate free solution by one of the following methods:

1. Dissolve 6 g of sodium hydroxide in 200 ml of water. heat to boiling, and slowly add to the boiling solution 5 ml of 5 % barium chloride solution. Allow the precipitate to settle, add a few drops of barium chloride solution and notice whether a fresh precipitate forms. If more precipitate is formed, add another 5 ml of the reagent, and again test for completeness of precipitation of carbonate. Continue in this manner until no further precipitate forms. Allow the precipitate to settle, decant off two-thirds of the clear solution, and dilute to 1 liter with freshly boiled water. Standardize by titrating weighed 0.6–0.8 g portions of dry potassium acid phthalate, dissolved in 100 ml of water. Use phenolphthalein indicator.

2. (Recommended method) Dissolve 7 g of sodium hydroxide in 7 ml of water and filter the viscous liquid through an asbestos mat in a Gooch crucible, with aid of suction. Catch the filtrate in a small dry test tube. Do not wash the residue. Pour off two-thirds of the clear filtrate and dilute to 1 liter with freshly boiled water.

3. Place within an empty vacuum desiccator a beaker of water and a dry beaker containing 2.3 g of sodium metal, cut into thin shavings. The sodium must be clean and free of oil. Connect the desiccator to a water aspirator pump and evacuate. In the atmosphere of water vapor thus formed, the sodium metal quickly reacts to form sodium hydroxide. Continue to evacuate the desiccator until all the metal has dissolved and a

SOLUTIONS FOR VOLUMETRIC ANALYSIS (Continued)

clear solution remains in the beaker. Dilute all this solution to 1 liter with freshly boiled water.

Sodium hydroxide, normal. (40.005 g per liter) Dissolve 42 g of sodium hydroxide sticks or pellets, of assay value 95 % or better, in water and dilute to 1 liter. Standardize with normal hydrochloric acid or sulfuric acid, using methyl orange indicator.

Oxidizing and Reducing Solutions

Arsenite, alkaline, decinormal. $\text{As}^{\text{III}} \rightarrow \text{As}^{\text{V}}$ (4.9465 g As_2O_3 per liter; equivalent to 0.0126932 g I or 0.0035457 g Cl per ml) Dissolve 4.9465 g of pure sublimed As_2O_3 in a concentrated solution of 4 g of NaOH, add 100 ml of a saturated NaHCO_3 solution and dilute to 1 liter. Do not warm the solution above 60°C when dissolving the As_2O_3 . Standardize against standard iodine solution with a starch indicator.

Ceric sulfate (oxidizing agent). Ceric sulfate is a strong oxidizing agent in acid solutions, is stable over a long period, can be used to titrate reducing agents in the presence of HCl and has only one valence change from 4 to 3. It can be used as a volumetric reagent in acid medium only since perceric compounds are formed in an alkaline medium. It cannot be used as its own indicator if the solution is colored.

1. The solution is made up for use by adding 64–66 g of ceric ammonium sulfate, $\text{Ce}(\text{SO}_4)_2 \cdot 2(\text{NH}_4)_2\text{SO}_4 \cdot 2\text{H}_2\text{O}$ or 35–40 g of ceric sulfate, $\text{Ce}(\text{SO}_4)_2$, to a solution of 500 ml of H_2O and 28 ml of concentrated H_2SO_4 . The solution should be stirred until all is dissolved and 500 ml more of distilled water added.

2. Alternative method. To 35 g of ceric oxide in a 600 ml beaker, add 46 ml of concentrated H_2SO_4 . Carefully add 50 ml of water and heat at boiling for five minutes. Cool somewhat and add, carefully, 450 ml of water. Digest until solution is complete. Filter, if necessary, dilute to 1000 ml and standardize.

The solution can be standardized against arsenious oxide dissolved in NaOH and acidified with H_2SO_4 ; against sodium oxalate or electrolytic iron by the Zimmermann-Reinhardt Method, using sodium diphenylamine sulfonate as indicator. The indicator acid is tri-ortho-phenanthroline ferrous sulfate, $(\text{C}_{12}\text{H}_8\text{N}_2 \cdot \text{H}_2\text{O})\text{FeSO}_4$. The reaction involved in the standardization with sodium oxalate is $\text{H}_2\text{C}_2\text{O}_4 + 2\text{Ce}(\text{SO}_4)_2 = 2\text{CO}_2 + \text{Ce}_2(\text{SO}_4)_3 + \text{H}_2\text{SO}_4$.

An amount of sodium oxalate is weighed out which will require 25–35 ml of 0.1 N ceric sulfate solution for titration. To this is added 10–20 ml of concentrated HCl, 5 ml of 0.005 M iodine chloride and enough water to make a volume of 100 ml. The solution should be heated to 50°C , 1 drop of indicator added, and the solution titrated with ceric sulfate until the solution becomes pale blue in color and there is no return of any pink color after one minute. The temperature should not fall below 45°C .

Ceric sulfate may be used to titrate ferrous chloride according

SOLUTIONS FOR VOLUMETRIC ANALYSIS (Continued)

to the reaction: $2\text{FeCl}_2 + 2\text{Ce}(\text{SO}_4)_2 + 2\text{HCl} = 2\text{FeCl}_3 + \text{Ce}_2(\text{SO}_4)_3 + \text{H}_2\text{SO}_4$.

Calcium may be precipitated as the oxalate, dissolved in dilute HCl and titrated with ceric sulfate. Chromium, arsenic, ferrocyanide and hydrogen peroxide may be titrated with ceric sulfate.

Iodine, decinormal. $\text{I}_2 \rightarrow 2\text{HI}$ (12.6932 g per liter) Dissolve about 13.5 g of pure sublimed iodine in a solution of 24 g of KI in 200 ml of H_2O and dilute to 1 liter. The solution is standardized by adding the iodine to a known volume of standard thiosulfate with a few drops of starch solution for the indicator.

Potassium dichromate, decinormal. $\text{Cr}^{\text{vi}} \rightarrow \text{Cr}^{\text{iii}}$ (4.904 g per liter) Grind about 5 g of potassium dichromate, of the purest grade obtainable, spread in a thin layer on a watch glass, and dry in an electric oven at 120–140° C for 2–4 hours. Cool in a desiccator and weigh to the nearest milligram. Transfer the powder to a 1 liter volumetric flask, with the aid of a funnel, and reweigh the watch glass with any adhering powder. Add water to the flask, shake until the sample is dissolved, dilute to volume and mix thoroughly. Compute the normality from the equation

$$\text{Normality} = \frac{\text{Weight potassium dichromate}}{49.04}$$

If pure dichromate is not available the solution may be standardized by iron wire or against an iron ore of known analysis. Weigh out three 0.2 g samples of clean, bright iron wire (prepared "for standardization", with purity factor of 99.8%) and transfer each to a 500 ml Erlenmeyer flask. Dissolve the wire in 10 ml of concentrated hydrochloric acid, keeping the flask covered with a small watch glass until solution is complete. Disregard a small residue of carbon which may remain in the solution as black particles. Rinse off the watch glass, heat the solution nearly to boiling and add stannous chloride solution (5 g of salt dissolved in 10 ml of concentrated hydrochloric acid, and diluted to 100 ml) a drop at a time until the solution is colorless. *Avoid an excess of over one drop of stannous chloride.* Cool completely and pour in 10 ml of saturated mercuric chloride solution. Allow to stand 2 minutes, then add a well cooled solution of 5 ml of 85% phosphoric acid in 200 ml of 3 N sulfuric acid (8:100). Add 6–8 drops of an indicator solution (containing 3 g of the sodium or barium salt of diphenylamine sulfonic acid per liter) and titrate with dichromate solution to the first appearance of a purple or violet tinge. The titration should be made slowly, since the reaction proceeds rather slowly. Run a blank. From the net volume of dichromate, compute the normality by the equation

$$\text{Normality} = \frac{\text{Weight of iron wire} \times \text{purity of iron}}{\text{Volume of dichromate} \times 0.05584}$$

Potassium permanganate, decinormal. $\text{Mn}^{\text{vii}} \rightarrow \text{Mn}^{\text{ii}}$ (3.1606 g per liter) Dissolve 3.3 g of dry KMnO_4 in 1 liter of

SOLUTIONS FOR VOLUMETRIC ANALYSIS (Continued)

distilled water and allow to stand at least 24 hours in a clean glass-stoppered bottle. The reasons for not using the freshly prepared solution are: 1st, the reducing agents in the water (dust, etc.) are thus all oxidized, and 2nd, any MnO_2 formed by this reduction is permitted to settle. The solution is then carefully siphoned through a clean glass tube into clean beakers, discarding the first 25 ml of solution and the last inch of the solution in the bottle which contains the precipitated MnO_2 ; the KMnO_4 solution should never be permitted to come in contact with rubber, filter paper or other organic matter. The solution in the beakers is now poured back into a clean bottle and standardized against sodium oxalate. Weigh out several 0.25–0.30 g samples of sodium oxalate having an assay value of 99.95 %, transfer each portion to a 600 ml beaker, and dissolve in 250 ml of dilute sulfuric acid (5:95). Stir until the oxalate has dissolved, then add rapidly* from a burette about 95 % of the amount of permanganate needed for complete oxidation of the sample (a preliminary titration is made with one sample to determine the approximate amount of permanganate needed). Allow the solution to stand until the permanganate is decolorized, then heat to 55–60° C and complete the titration at this temperature, stirring *gently* with a thermometer and allowing each drop to become decolorized before adding the next. The end point is shown by a faint pink tinge which persists for 30 seconds. Run a blank on 250 ml of dilute sulfuric acid, heated to 60° C. From the net volume of permanganate, compute the normality by the equation

$$\text{Normality} = \frac{\text{Weight sodium oxalate} \times \text{purity}}{\text{Volume permanganate} \times 0.067}$$

Sodium thiosulfate, decinormal. $2\text{Na}_2\text{S}_2\text{O}_3 \rightarrow \text{Na}_2\text{S}_4\text{O}_6$ (24.8192 g of $\text{Na}_2\text{S}_2\text{O}_3 \cdot 5\text{H}_2\text{O}$ per liter) Do not dry the sodium thiosulfate in an oven as it can be obtained almost pure; weigh out 25.0 g and dilute to exactly 1 liter. After mixing thoroughly, the solution is allowed to stand two weeks. If free sulfur has separated, the clear liquid is siphoned off. The solution is standardized indirectly by titration with potassium dichromate (see above). Dissolve 5 g of KI and 4 g of NaHCO_3 in 300 ml of H_2O in a 500 ml Erlenmeyer flask at room temperature and then add HCl slowly, swirling the flask, until there is no more evolution of CO_2 and then add about 10 ml more acid; add 35 ml of 0.1 N $\text{K}_2\text{Cr}_2\text{O}_7$, mixing the solutions, rinse the sides of the flask with a few ml of water, allowing it to form a layer over the solution without mixing; stopper the flask and allow to stand about 10 minutes. Then with thorough mixing run in thiosulfate until the solution is a light yellow, add a few drops of starch solution and continue with a slow addition of thiosulfate until the bright blue color has disappeared and only the pale green color of CrCl_3 remains.

* The method given for standardization is based upon the directions of Fowler and Bright, Bur. Stand. J. Res., 15, 493 (1935).

REAGENTS FOR SEMI-MICRO QUALITATIVE ANALYSIS

Compiled by D. W. Pearce

The following reagents have been found extremely sensitive as confirmatory tests for the ions indicated. In most cases separation from other ions by micro or semi-micro technique should precede the test. For interferences, references to original literature, and detailed procedures see Feigl, "Qualitativ Analyse mit Hilfe von Tupfelreactionen", or Engelder, Dunkelberger and Schiller, "Semi-Micro Qualitative Analysis". Also see table, *Organic Analytical Reagents*, for other reagents.

Ammonium molybdate. Dissolve 15 g of ammonium molybdate in 300 ml of water, add 100 ml of nitric acid (1:2) and saturate with ammonium nitrate. Fine yellow precipitate for H_2PO_4^- (cold) or H_2AsO_4^- (60°C) in nitric acid solution.

Aniline sulfate. Concentrated solution of aniline sulfate in concentrated sulfuric acid. Reagent gives instant blue color with ClO_3^- ; other strong oxidants as NO_3^- give the blue color much more slowly.

Benzidine acetate—cupric acetate. (a) Dilute 47.5 ml of saturated benzidine acetate solution to 100 ml. (b) Dissolve 0.286 g of cupric acetate in 100 ml solution. Solution (a) + solution (b) on spot paper gives blue color with HCN vapors.

α -Benzoinoxime. 5% alcoholic solution. Green precipitate with Cu^{++} in slightly ammoniacal solution.

Bettendorff's reagent. Saturated solution of SnCl_2 in concentrated HCl . Brown color or black precipitate upon adding As^{+3} (immediate) or As^{+5} (on standing), to excess of the reagent.

Brucine reagent. 0.02 g of brucine dissolved in 100 ml of concentrated sulfuric acid. Test solution + concentrated sulfuric acid + brucine reagent gives fleeting red color with NO_3^- , NO_2^- , or ClO_3^- .

Cacothelin. Fresh, saturated aqueous solution of cacothelin. Use a drop of reagent on test paper, warm till only slightly damp; drop of Sn^{+2} (reduced by means of Mg powder) gives violet color. Antimony does not interfere.

Cinchonin—potassium iodide reagent. One gram of cinchonin is dissolved in 100 ml of water upon the addition of a few drops of HNO_3 and warming; add 2 g of KI . Bright red-orange precipitate with Bi^{+++} , brown with Cu^{++} , yellow with Pb^{++} , white with Cd^{++} , and cream with Hg^{++} , in slightly acid solution.

Cobalticyanide paper (Rinnmann's green test). Saturate quantitative filter paper in a solution of 4 g of $\text{K}_3\text{Co}(\text{CN})_6$ and 1 g of KClO_3 in 100 ml of water. Dry. Add drop test solution and ash the paper in a crucible over flame. Green ash—presence of Zn^{++} .

amounts of rhodamine and *p*-dimethylaminobenzaldehyde in glacial acetic acid, warm on steam bath. Product may be crystallized out on addition of water.) Reagent for detection of Ag^+ (and Hg^{++}) in nitric acid solution. Red-violet precipitate.

Dimethylglyoxime. 1 g dissolved in 100 ml of alcohol. In presence of much Co^{++} first add slight excess NaCN , warm till decidedly orange, add reagent and AgNO_3 . Pink to red precipitate—presence of Ni^{++} .

Diphenylcarbazide. 1% alcoholic solution, freshly prepared. Violet or blue precipitate in neutral or slightly acid solution of $\text{Hg}(\text{NO}_3)_2$.

α -Nitrobenzeneazoresorcinol. 0.001 g dissolved in 100 ml of 2 *N* NaOH . Sky blue precipitate with Mg^{++} .

Potassium thiocyanate. Saturated aqueous solution. With HCl solution of CO^{++} yields deep blue color; best observed when extracted with amyl alcohol-ether (1:6). Fe^{+++} , if present, to be reduced with crystal of $\text{Na}_2\text{S}_2\text{O}_3$.

Rhodamine B. Dissolve 0.01 g of tetraethylrhodamine in 100 ml of water. Violet color with Sb^{+5} (oxidized with KNO_2 crystal). Tin does not interfere.

Sodium nitroprusside. Freshly prepared 1% aqueous solution. Deep violet color with S^{--} (alkaline).

Sulfanilic acid— α -naphthylamine. (a) 0.4 g of sulfanilic acid in 100 ml of 10% acetic acid. (b) 0.5 g of α -naphthylamine boiled in 100 ml of water; filter. Acetic acid + solution (a) + solution (b) gives brilliant red color with NO_2^- .

Tetramethyldiaminodiphenylmethane. Acetic acid solution. Blue color as sensitive test for Pb^{++} . (Must be previously oxidized to PbO_2 in ammonia solution with H_2O_2 and the latter decomposed by warming or standing.)

Zinc uranyl acetate. Dissolve 10 g of uranyl acetate, with warming, in 6 g of 30% acetic acid; dilute to 50 ml. Treat 30 g of zinc acetate with 3 g of 30% acetic acid; dilute to 50 ml. Mix the two solutions, add a trace of NaCl , let stand 24 hours and filter out the precipitate. Yellowish-green crystalline precipitate with Na^+ .

Zirconium alizarin sulfonate reagent. (a) Dissolve 0.05 g of zirconium nitrate in 50 ml of H_2O and 10 ml of concentrated HCl . (b) Dissolve 0.05 g of alizarin red S in 50 ml of H_2O . Mix (a) and (b) to make the reagent. Gives immediate yellow color with F^- (oxalates or phosphates interfere, giving yellow color slowly).

ACID DILUTION BY VOLUME

The volume of pure acid (or water) which must be added to 50 cm³ of water (or acid) to give solutions of specific gravity shown. Temperature 20°C. Taken from curves prepared by W. W. Stiles, based on experimental determinations. The values are approximate only.

G. Miscellaneous

For the determination of substances that must pass through complicated reactions, it is best to standardize against a standard sample of the substance that has been carried through all steps of the analysis. The U S Bureau of Standards can supply at a nominal fee a large number of standard samples of irons and steels (representing a wide range in composition), iron ores, manganese ore, zinc ore, etc.

- (1) May be obtained from the U. S. Bureau of Standards.
- (2) Difficult to obtain with exactly two molecules of water but a valuable primary standard when carefully prepared
- (3) The pure salt is hard to obtain and to keep without slight oxidation or loss of water, hence other standards are recommended
- (4) Possesses many disadvantages and is not recommended
- (5) The last few drops of iodine are decolorized very slowly. Titrate till the pale yellow color persists at least two minutes. Starch retards the reaction and should be avoided.

TRUE CAPACITY OF GLASS VESSELS FROM THE WEIGHT OF THE CONTAINED WATER OR MERCURY WHEN WEIGHED IN AIR WITH BRASS WEIGHTS*

A glass vessel containing G grams of water at a temperature of $t^{\circ}\text{C}$ has, at the same temperature, a capacity $V = W_t \times G$ cubic centimeters. Similarly when filled with G grams of mercury at a temperature of $t^{\circ}\text{C}$ the capacity at the same temperature is given by $V = M_t \times G$ cubic centimeters.

A glass vessel containing G grams of water at a temperature of $t^{\circ}\text{C}$ has a capacity at a temperature of 18°C given by $V = W_{18^{\circ}} \times G$ cubic centimeters. Similarly when filled with G grams of mercury at a temperature of $t^{\circ}\text{C}$ the capacity at a temperature of 18°C is given by $V = M_{18^{\circ}} \times G$ cubic centimeters. The true volume at temperature of 25°C when the weighing is made at t° is similarly obtained by use of the values under $W_{25^{\circ}}$ and $M_{25^{\circ}}$ for water and mercury respectively

Reduction of Weighings to Vacuo

If the apparent mass of a body is m , its density d_m , the density of the weights d_w and the density of the air d_a the true mass in vacuo is,

$$M = m + md_a \left(\frac{1}{d_m} - \frac{1}{d_w} \right)$$

B Drying agents depending upon physical action (adsorption) for their efficiency *—Alumina (low temperature fired), asbestos, charcoal, clay and porcelain (low temperature fired), glass wool, kieselguhr, silica gel, refrigeration

* It should be noted that the efficiency of some drying agents (*e. g.* Al₂O₃, zH₂O and anhydrous CaCl₂, and probably also BaO, anhydrous Mg(ClO₄)₂, Mg(ClO₄)₂·3H₂O, anhydrous Ba(ClO₄)₂, and CaSO₄ $\frac{1}{2}$ H₂O) depends upon both adsorption and absorption.

A METHOD OF BALANCING EQUATIONS FOR OXIDATION-REDUCTION REACTIONS

On the left-hand side of the equation write the formulae for all the compounds entering into the reaction. On the right-hand side write the formulae for all the compounds formed in the reaction.

Determine the L. C. M. (least common multiple) of the numbers representing the changes in valence per molecule of the oxidizing and reducing agents.

The quotient obtained in dividing the L. C. M. by the number representing the valence change per molecule is the number of molecules of that compound required, or formed.

The reaction between FeSO_4 , KMnO_4 , and H_2SO_4 serves to illustrate. Following the rule as given above we write, $\text{KMnO}_4 + \text{FeSO}_4 + \text{H}_2\text{SO}_4 \longrightarrow \text{K}_2\text{SO}_4 + \text{MnSO}_4 + \text{Fe}_2(\text{SO}_4)_3 + \text{H}_2\text{O}$.

The valence change of manganese is five, that of iron is two per molecule of $\text{Fe}_2(\text{SO}_4)_3$. The L. C. M. of these two numbers is ten.

The quotient obtained by dividing the L. C. M. by the valence change of manganese is two. Therefore two molecules of KMnO_4 are required. The quotient obtained by dividing the L. C. M. by the valence change of iron per molecule of $\text{Fe}_2(\text{SO}_4)_3$ is five. Five molecules of $\text{Fe}_2(\text{SO}_4)_3$ are formed. Ten molecules of FeSO_4 are needed. From the two molecules of KMnO_4 used one molecule of K_2SO_4 is formed, as well as two molecules of MnSO_4 .

Eighteen sulfate radicals are used in forming the salts; ten of these radicals are supplied by the FeSO_4 used, the other eight must be supplied by the free acid. The sixteen hydrogens form eight molecules of water.

The complete equation is, therefore,

SOLUBILITY OF INORGANIC COMPOUNDS IN WATER

The table shows the number of grams of the anhydrous substance indicated in the first column which can be dissolved in 100 grams of water at the temperature in degrees Centigrade given at the top. When the formula is preceded by * the solubility is stated in grams of anhydrous substance in 100 grams of saturated solution; when preceded by ** the solubility is stated in grams of anhydrous substance in 100 c.c. of the saturated solution. The column headed with S. P. shows the solid phase hydrated form in equilibrium with the saturated solution.

SOLUBILITY OF

α , the absorption coefficient, is the volume of gas when reduced to 0° and 760 mm., absorbed by one volume of water when the pressure of the gas itself, without the aqueous tension, amounts to 760 mm.

q is the weight of gas in grams dissolved in 100 grams of water when the total pressure (i.e., the sum of the partial pressure of the gas plus the aqueous tension at the given temperature) is 760 mm.

TABLE OF INDICATORS

Due to hydrolysis of the salt formed, the composition of a weak acid solution titrated against a strong base is basic (when equivalent amounts of acid and base are present) and of a weak base against a strong acid is acid. A truly neutral titrated solution has the same concentration of hydrogen ions [H⁺] and hydroxyl ions [OH⁻] as water. Water has a concentration of [H⁺] ion of 10⁻⁷ and of [OH⁻] ion of 10⁻⁷ at 25°C. As an index of the acid intensity the expression pH is employed and is equal to the logarithm of the reciprocal of the hydrogen ion concentration; i. e., $pH = \log \frac{1}{[H^+]}$ per liter. From this it follows that the pH of a neutral solution is the same as that of water; viz., 7; an acid solution has a pH less than 7 and a basic solution has a pH greater than 7. Those indicators in the table below with a * are the Sørensen selected indicators; those with a # are the Clark and Lubs selected indicators; those with the ## are Cohen's supplement to the Clark and Lubs selection; those with the E are the Eastman indicators.

PREPARATION OF CLARK AND LUBS INDICATOR SOLUTIONS

To prepare a 0.04% indicator reagent, 0.1 gram of the dry indicator is mixed in a mortar with the number of cubic centimeters of 0.01 *N* sodium hydroxide as given in the table below and the mixture diluted to 250 cc with water. Such solutions give satisfactory results when five drops of indicator are added to 10 cc of the solution to be tested.

CONVERSION FACTORS—pH TO E. M. F.

When the half-cell:

KCl (saturated)|KCl (0.1*N*), HgCl (s)|Hg is used as a standard of reference and it is assumed, arbitrarily that in the cell:
 Pt, H₂ (1 atmosphere)|H⁺ (unknown activity)|KCl (saturated)
AB
CD
 |KCl (0.1*N*), HgCl (s)|Hg

the potential difference at B remains constant with variations of "H (unknown activity)" and that the sum of the potential differences at B, C and D is Σ as follows: (cf. Clark: *Determination of Hydrogen Ions*, 3d Ed., 1928).

<i>t</i> °C.....	18	20	25	30
Potential difference (Σ) volts....	0.3380	0.3379	0.3376	0.3371
<i>t</i> °C.....	35	38	40	
Potential difference (Σ) volts.....	0.3365	0.3361	0.3358	

then,

$$\text{pH} = \frac{\text{E. M. F.} - \Sigma}{0.00019832 \times T} \text{ where } T \text{ is the absolute temperature.}$$

CALOMEL ELECTRODE

The voltage of the calomel electrode at 25°C. is for the half-cell:

From this the relation of the E. M. F. and pH (of a cell composed of a hydrogen electrode and one of the calomel electrodes) is given by:

$$\text{pH} = \frac{E. M. F. - \Sigma}{0.0591} \quad (\text{at } 25^\circ\text{C.})$$

QUINHYDRONE ELECTRODE

The normal electrode potential (E_h) of the quinhydrone electrode referred to the normal hydrogen electrode at $t^\circ\text{C.}$ is given by the expression:

$$E_h = 0.7177 - 0.00074t$$

pH VALUES FOR POTENTIOMETER READINGS

Harold V. Gaskill

The following table presents pH values for various potentiometer readings using the quinhydrone half-cell and saturated calomel half-cell at 25°C. The argument is potential in millivolts and the table entries are in terms of pH. The table was constructed upon the following formula:

$$\text{pH} = \frac{0.4538 - E_q}{0.0591}$$

in which E_q is the observed potential in volts.¹

The temperature factor is 0.77 millivolts per degree, to be added above 25°C and subtracted below 25°C.

Polarity is reversed above 7.68 pH.

APPROXIMATE pH VALUES

The following tables give approximate pH values for a number of substances such as acids, bases, foods, biological fluids, etc. All values are rounded off to the nearest tenth and are based on measurements made at 25° C. A few buffer systems with their pH values are also given.

BUFFER SYSTEMS

The following table gives some common buffer systems and the approximate pH of maximum buffer capacity. The zone of effective buffer action will vary with concentration but, for concentrations approximately 0.1 molar, the general average will be ± 1.0 pH from the value given.

Glycocoll-sodium chloride-hydrochloric acid	..	2.0
Potassium acid phthalate-hydrochloric acid	..	2.8
Primary potassium citrate	.	3.7
Acetic acid-sodium acetate	4.6
Potassium acid phthalate-sodium hydroxide	.	5.0
Secondary sodium citrate	5.0
Potassium acid phosphate-disodium phosphate		6.8
Potassium acid phosphate-sodium hydroxide	..	6.8
Boric acid-borax	..	8.5
Borax	9.2
Boric acid-sodium hydroxide		9.2
Sodium bicarbonate-sodium carbonate		10.2
Disodium phosphate-sodium hydroxide	..	11.5

POTENTIALS OF ELECTROCHEMICAL REACTIONS AT 25° C

Compiled by Thos. DeVries

The reactions are classified according to the main element or radical entering into the reaction. Radicals are found under the name of the parent element. The sign of the potential is the sign on the electrode, according to the "European system".

SOLUBILITY PRODUCT

The solubility product (or ion product constant) is the product of the concentrations of the ions in the saturated solution of a difficultly soluble salt. The concentrations are expressed as moles per liter of solution. The number of cations (or anions) resulting from the dissociation of one molecule of the salt, appears in the formula for calculations of the solubility product as the exponent of the concentration of the cation (or anion).

If two solutions, each containing one of the ions of a difficultly soluble salt, are mixed, no precipitation takes place unless the product of the ion concentrations in the mixture is greater than the solubility product.

In a solution containing two salts which yield a common ion the ratio of solubilities of the two salts is the ratio of the solubility products.

PROPERTIES OF THE AMINO ACIDS

Compiled by M. S. Dunn
with the cooperation of Frank J. Ross and M. Palmer Stoddard

Data are given in the following tables for the *dl*, *d*(+), *d*(-), *l*(+), and *l*(-) forms of the amino acids which are considered to be constituents of native proteins. All of the naturally occurring forms of the amino acids have the "*l*" configuration around the alpha carbon atom. The symbols (+) and (-) refer to the direction of rotation in water at 25°C. The values quoted are those considered to be most reliable.

IONIZATION CONSTANTS AND pH VALUES AT THE ISOELECTRIC POINTS OF THE AMINO ACIDS IN WATER AT 25°C

The majority of the recorded values are true thermodynamic constants calculated from electrometric force measurements of cells without liquid junctions. The values for the constants given in the table were derived from the classical, the zwitterionic (Bjerrum), and the acidic (Bronsted) formulations of ionization and the corresponding mass law expressions. pH values at the isoelectric points were calculated from the expression, $pI = \frac{1}{2}(pK_{A1} + pK_{A2} + pK_{B1} - pK_{B2})$. The error is approximately 0.5 per cent when this expression is used to calculate pI values for cystine, tyrosine, and diiodotyrosine.

Specific Rotations of the Amino Acids Using Sodium Light (5893 Å)

Abbreviations

c—grams of solute per 100 ml. of solution.

d—density of the solution.

p—grams of solute per 100 grams of solution.

l—length of the tube in decimeters.

α —observed rotation in angular degrees.

$[\alpha]$ —specific rotation in angular degrees calculated from

$$[\alpha]_{\lambda}^t = \frac{\alpha \times 100}{c \times l} = \frac{\alpha \times 100}{p \times d \times l} \text{ where } t \text{ is temperature in } ^\circ\text{C and } \lambda \text{ is wave}$$

length of the incident light in Ångströms.

A—prepared from a protein or other naturally occurring material.

B—prepared by resolution of the inactive synthetic form.

C—prepared by resolution of the inactive racemized form.

D—prepared from the inactive synthetic form by a biological method.

E—prepared from the inactive racemized form by a biological method.

?—source not given.

† Dunn and Stoddard (7) report 2.19 g. at 25° for *l*(-)-leucine rendered methionine-free by repeated recrystallization from 6 *N* HCl. Hlynka (8) found 2.20 g. at 25° and 2.66 g. at 50° for *l*(-)-leucine rendered methionine-free [by S. W. Fox (9)] by fractional crystallization of the formyl derivative and identical values for *d*(+)-leucine obtained by resolution of the *dl*-form.

‡ The following values were found by Loring and du Vigneaud (10): *dl*-cystine (0.0049g), *d*(+)-cystine (0.0108 g), and *meso*-cystine (0.0056 g) at 25°.

1. Action of Metals on Salts.—Any metal will replace any other metal below it in the series thus:

This is the fundamental principle of the Daniell Cell. The voltage of such a cell depends upon the difference between the electrode potentials of the metals employed. Thus the Zn-Cu couple gives a greater E.M.F. than the Zn-Pb couple or the Fe-Cu couple.

ELECTROMOTIVE FORCE SERIES OF ELEMENTS (Continued)

2. **Action of Metals on Acids.**—Metals above H_2 react with HCl and dilute H_2SO_4 , replacing the H_2

Metals above Pt react with HNO_3 and *hot conc* H_2SO_4

The acid first oxidizes the metal and the reaction may be explained as follows

Some of the acid takes on water and ionizes thus:

Nitrogen gains 3 electrons and copper loses 2 electrons:

Some of the acid ionizes as follows:

added

3. **In Regard to Ease of Reduction of Oxides.**—The metallic oxides down to and including Mn can not be completely reduced to the metal state, even in a current of hydrogen. The oxides of Cd and succeeding metals are easily reduced, and far down the list, the oxides of silver, platinum, mercury, and gold are reduced (decomposed into metal and oxygen) even by heat alone

4. **In Regard to Ease of Rusting. (Oxidation in the Air.)**—The alkali and alkaline-earth metals rust very rapidly and with considerable evolution of heat. All the metals down to copper rust with comparative ease. The metals below copper do not rust. Assuming the electrolytic theory of the process of rusting to be true, these facts are just about what might have been predicted.

5. **In Regard to the Occurrence of the Metals in the Free State in Nature.**—Natural waters are frequently dilute solutions of carbonic, nitric, humic, etc., acids. As such they contain displaceable hydrogen. Metals *above* hydrogen in the E.M.F. series scarcely, if ever, occur in the free state in nature, but are practically without exception found in the combined state, as sulfides, carbonates, etc. Metals *below* hydrogen are frequently found in the free state in nature. Thus gold is found in the form of nuggets of metallic gold. However, metals below hydrogen are also found in the combined state, as cinnabar, HgS , etc.

6. **In Regard to Action of the Metals on Water.**—The alkali and alkaline-earth metals displace hydrogen from water, even in the cold, and with evolution of much heat. Mg and succeeding metals will displace hydrogen from steam. Metals at the bottom of the list will not displace hydrogen from steam.

7. **In Regard to the Solubility and Stability of Hydroxides.**—The alkali metal oxides have great avidity for water, forming hydroxides. The alkaline-earth metal oxides react with less readiness, forming hydroxides. MgO reacts slowly and incompletely with water, forming the hydroxide. All the other metallic oxides and hydroxides are insoluble in water and have no perceptible reaction therewith. When a solution of $NaOH$ acts on solutions of salts of the metals, the alkali metal salts are not precipitated. The alkaline-earth metal salts are not precipitated unless in very concentrated solution. All the other metal solutions are acted upon, with precipitation of hydroxides, except in the case of copper which first gives copper hydroxide (blue), and which, on warming, changes to copper oxide (black). Also in the case of arsenic, no precipitate falls, sodium arsenite being formed. In the case of the last metals in the series, the *oxide* is precipitated, instead of the hydroxide, thus $NaOH$ acting on salts of Sb , Hg , Ag , Pd , Pt , and Au , causes a precipitation of the *oxides* of these metals. Bismuth, as an exception, gives a normal hydroxide.

ELECTROMOTIVE FORCE SERIES OF ELEMENTS (Continued)

8. **In Regard to Carbonates.**—The alkali metals form normal stable, soluble carbonates, not easily decomposed on heating. The alkaline-earth metals form normal carbonates, which are insoluble in water, and which decompose upon heating, leaving the oxide, carbon dioxide being evolved. When sodium carbonate solution acts on solutions of all the other metals, as a rule, a basic carbonate is precipitated, being insoluble in water, and decomposed by heat into oxide and carbon dioxide. If the solution is cold, Ag, Hg, Cd, Fe, and Mn give normal carbonates. If the solution is warm, Sb, Hg, Ag, Pd, Pt, and Au give a precipitate of the *oxide*, instead of the carbonate, thus showing the instability of the carbonates of the lowest metals in the series.

9. **In Regard to Nitrates.**—The nitrates of the alkali metals decompose when strongly heated forming the *nitrite* and oxygen. The nitrates of the heavy metals, down to and including copper, decompose when heated forming the oxide of the metal, oxygen and nitrogen dioxide. Mercury nitrate when heated yields mercury, oxygen and nitrogen dioxide.

Procedure

Into a test tube (15 × 150 mm.) pipette 1 c.c. 0.1 normal NaOH and 5 c.c. 0.45% zinc sulfate solution; 0.1 c.c. of blood from a capillary pipette is added being washed out with the mixture in the test tube; heat for 3 minutes in a boiling water bath; filter through cotton into a test tube (30 × 90 mm.) and wash the filter with two 3 c.c. portions of water. Add 2 c.c. of alkaline ferricyanide solution (1.65 g potassium ferricyanide, 10.6 g anhydrous sodium carbonate in 1000 c.c. of water) and heat in a boiling water bath for 15 minutes; cool and add 3 c.c. of the iodide-sulfate solution (5 g potassium iodide, 10 g zinc sulfate, 50 g sodium chloride and sufficient water to make 200 c.c.) and 2 c.c. of 3% acetic acid solution. Titrate with 0.005 normal sodium thiosulfate using starch indicator. The method is based upon the reduction of alkaline ferricyanide by glucose and the subsequent titration of the excess unreduced ferricyanide according to the following equation: $2\text{H}_3\text{Fe}(\text{CN})_6 + 2\text{HI} = 2\text{H}_4\text{Fe}(\text{CN})_6 + \text{I}_2$

To 2 c.c. of 0.0667 normal H₂SO₄ in a test tube add 0.2 c.c. of blood, rinsing the pipette several times with the liquid in the test tube; add exactly 0.8 c.c. of 2.5% sodium tungstate solution; centrifugate; fasten a small tuft of absorbent cotton over the end of a 2 c.c. pipette and with this pipette remove 2 c.c. of the blood filtrate in the test tube and deliver it into a 16 × 150 mm test tube; add exactly 2 c.c. of the sugar-copper reagent; mix; heat in a boiling water bath for 15 minutes; cool to 35°C; add 1 c.c. 2 normal H₂SO₄ and titrate with 0.005 normal Na₂S₂O₃. A blank using 0.2 c.c. of water in place of the blood is run at the same time.

* Modified tartrate-carbonate copper reagent.—Copper sulfate (crystalline) 6.5 g; Rochelle salt 12 g; sodium carbonate (anhydrous) 20 g; potassium iodide 10 g; potassium iodate 0.8 g; potassium oxalate 18 g; sodium bicarbonate 25 g; water sufficient to make one liter of solution.

CUPROUS OXIDE EQUIVALENT OF DEXTROSE, INVERT SUGAR, LACTOSE AND MALTOSE

(Munson and Walker, Jour. Amer. Chem. Soc. 28, 663 (1906.))

Add exactly 25 c.c. of Fehling Solution A and 25 c.c. of Fehling Solution B (see under *Special Solutions and Reagents*) to 50 c.c. of reducing sugar solution (if a smaller volume of sugar solution is used, add sufficient water to make the final solution 100 c.c.); heat the solution at such a rate that boiling begins in four minutes and continue boiling for exactly 2 minutes, keeping the beaker covered with a watch glass; filter immediately on a Gooch crucible using suction; wash thoroughly with water at 60°C., then with 10 c.c. of alcohol and finally with 10 c.c. of ether; dry for 30 minutes in an oven at 100°C., cool in a desiccator and weigh as cuprous oxide.

GRAVIMETRIC FACTORS AND THEIR LOGARITHMS

Computed from the International atomic weights of 1936* by Eric A. Arnold.
To facilitate the use of the table the group of substances weighed given under each element as well as the substances sought under each substance weighed are arranged in the alphabetical order of their formulae.

HEAT OF FORMATION AND SOLUTION

The following table gives the heat of formation of compounds from the elements in their standard states (18° C, 1 atm.) and the heat of solution in water in kilogram calories (mean) per gram-formula weight. To convert to B.T.U. multiply by 3.9685. To convert to kilojoules multiply by 4.186.

Values given are for 18° C and 1 atm. unless otherwise indicated. The heat of solution is given in most cases for a definite number of water molecules to one of the substance. Where this is not stated the dilution is understood to be such that additional dilution produces a negligible thermal effect.

The symbol ∞ indicates that the substance is formed in an "infinite" amount of water.

HEAT OF COMBUSTION FOR ORGANIC COMPOUNDS

The heat of combustion is given in kilogram calories per gram molecular weight of the substance when combustion takes place at atmospheric pressure and 20° C. The final products of combustion are gaseous carbon dioxide, liquid water and nitrogen gas for C, H, N compounds. For method of computing heats of formation see statement following this table.

HEAT OF FORMATION

FOR ORGANIC COMPOUNDS

The heat of formation of a compound "A" is equal to the sum of the heats of formation of the products of combustion minus the heat of combustion (see preceding table) of the compound "A." The heat of formation of:

Free elements.....	0	kg-cal
CO ₂ (gas).....	94.38	"
$\frac{1}{2}$ H ₂ O (liquid from 1 H).....	34.19	"
HF (dilute aqueous solution).....	75.6	"
SO ₂ (gas).....	69.3	"
HBr (aqueous solution).....	28.54	"
HCl (aqueous solution).....	39.46	"
HNO ₃ (aqueous solution).....	49.80	"
H ₂ SO ₄ (aqueous solution).....	207.5	"

Example I

To calculate the heat of formation of methane (CH₄) where

Heat of combustion of methane	= 210.8
Heat of formation of CO ₂	= 94.38
Heat of formation of $\frac{1}{2}$ H ₂ O	= 34.19

and where the combustion occurs according to the equation:

Then the heat of formation of CH₄ = 94.38 + 4(34.19) - 210.8 = +20.34 kg-cal. per gram molecular weight.

Example II

To calculate the heat of formation of ethylene (C₂H₄) where

Heat of combustion of ethylene = 331.6

and the combustion occurs according to the equation:

The heat of formation of C₂H₄ = 2(94.38) + 4(34.19) - 331.6 = -6.08 kg-cal. per gram molecular weight.

Example III

To calculate the heat of formation of ethylamine (C₂H₅NH₂) where

Heat of combustion of ethylamine = 408.5

and the combustion occurs according to the equation:

The heat of formation of C₂H₅NH₂ = 2(94.38) + 7(34.19) + O(N₂) - 408.5 = +19.59 kg-cal. per gram molecular weight.

COMBUSTION CONSTANTS OF GASES

The flue products are based upon air with 21% oxygen and 79% nitrogen; flame temperatures are not corrected for dissociation; the high or gross heat value is one which would be obtained by burning in a Junker's calorimeter; it includes the heat of condensation of the water formed by combustion and assumes that all products of combustion are cooled to the initial temperature; the low or net heat value assumes that all of the products of combustion except water have been cooled to the initial temperature; the difference between the gross and the net is equal to the heat of vaporization of water at the initial temperature.

FUEL GASES

HEATS OF COMBUSTION AND COMPOSITION OF MANUFACTURED AND NATURAL GASES

Products of combustion, theoretical flame temperatures, air required and B.T.U. of gas-air mixture are based upon air with 21 % oxygen and 79 % nitrogen; heat values are calculated from the table as given under "Combustion Constants of Gases;" flame temperatures are not corrected for dissociation; carburetted water gas, coal gas, coke-oven gases and oil gas contain a small amount of benzene and oxygen.

FREE ENERGY

The free energy change of a chemical reaction is the sum of the free energies of formation from their elements of the products of the reaction less the free energy of formation of the reacting substances.

The free energy values ΔF° given in the following table refer to the energy of formation from the elements in their standard states at 25° C. The free energy of all elements in their standard states and of H^+ is taken as zero.

Values are in kilogram calories per mole at 25 °C.

VITAMINS

Factor and synonyms	Description and properties	Importance	Deficiency symptoms	Chief natural sources
Vitamin A (animal sources) Carotenes (plant sources) (provitamin A)	Vitamin A₁ ($C_{20}H_{30}OH$) Vitamin A₂ ($C_{27}H_{44}OH$) Pale, viscous, fat-soluble, heat and oxygen labile liquids found in fish liver oils. Carotenes —orange red pigments—Kryptoxanthin, alpha and beta carotene—found in plants and are precursors of vitamin A being changed to this vitamin in the human body. Have same fat soluble and labile properties of vitamin A especially to oxidation. One molecule of beta carotene has physiological potency of two molecules of vitamin A. Alpha carotene has 50% activity of beta carotene.	Vitamin A is essential for growth, normal vision and for maintenance of normal condition of epithelial tissue. Prevention of nyctalopia (night blindness) and regeneration of retinal visual purple bleached by light. Dried out epithelial tissue deficient in vitamin A seems to have less resistance to invasion by bacteria. Requirements are greatest during periods of rapid growth, pregnancy, lactation or illness.	Dryness and keratinization of the eye conjunctiva (xerophthalmia) hyperkeratosis of mucous membrane and dermal structures. Dryness of skin. Retardation of growth.	Leafy portions of green plants Salt water fish liver oils—A ₁ Fresh water fish liver oils—A ₂ Eggs Butter Cream Provitamin A found in pigmented plants such as carrots, sweet potatoes, yellow corn, etc. Apricots
Fat soluble A Anti-Xerophthalmic vitamin				
Vitamin B₁ Thiamin chloride Thiamin hydrochloride Aneurin Anti-beri-beri vitamin Anti-neuritic vitamin	A white crystalline powder having the formula $C_{12}H_{17}NO_4S$. Soluble in alcohol and water. Heat and alkali labile stable to aeration.	Necessary in formation of enzymes participating in carbohydrate metabolism. Essential for maintenance of good appetite; normal	Retarded growth, loss of appetite, leg weakness, convulsive seizures associated with spastic paralysis and focal accumulation	Liver Yeast Milk Eggs Fruits Legumes

Vitamin B₁ ... (Member of the vitamin B Complex) Riboflavin Vitamin G Lactoflavin (from milk) Ovoflavin (from eggs) Hepatoflavin (from liver)	Molecular structure includes a pyridine and thiazole group which is broken down by sulfite treatment. An orange yellow pigment ($C_{17}H_{20}N_4O_6$) containing an iso-alloxazine nucleus combined with d-ribose. Solutions of riboflavin exhibit a strong greenish-yellow fluorescence in ultra violet which is the basis for fluorometric assay of this vitamin. Riboflavin is water soluble, heat stable in acid or neutral solutions and readily destroyed in an alkaline medium. Visible light (blue and violet regions) destroys this vitamin.	digestion and gastric tonicity. Necessary for lactation and reproduction. Lack of vitamin B ₁ has been responsible for various forms of nerve disturbances and suboptimal growth of infants and children. Necessary for growth and respiration of all tissues and cells. Has been demonstrated to increase vitality and postpone senility in succeeding generations of experimental animals. Necessary for growth of domestic animals. Necessary for egg hatchability.	of pyruvic acid in central nervous systems with accompanying polyneuritis. Emotional instability and enlargement of heart.	Leafy vegetables Lean meat Embryos of cereal grains
Niacin Nicotinic acid Pellagra preventive P-P factor	3-pyridine carboxylic acid which is somewhat soluble in hot water. The amide derivative is	A component of co-enzymes important in glycolysis and cellular respiration.	A reddening and slimy denuded appearance of the lips, waxy accumulations at the nasolabial folds of the skin, ocular lesions accompanied by burning sensation and light sensitivity, roughening of skin around the mouth and across tip of nose. Anti-black tongue factor (Member of vitamin B complex)	more soluble and called niacinamide. Relatively stable to heat.	Essential for health and growth. Necessary for maintaining normal function of skin and gastro-intestinal tract.	Deficiency causes pellagra.	Yeast Eggs Fish Bran Green leafy vegetables
Vitamin B₆ (Member of vitamin B complex) Pyridoxin Adermin Rat acrodynia factor	Derivative of pyridine. Commercially available as hydrochloride—white powder ($C_5H_7NO_2 \cdot HCl$) which is stable in solution in absence of strong light. Acid solutions stable to autoclaving below pH 5.	Significance in human nutrition not fully established. Has been found useful in alleviating certain nervous and muscular disorders. Probably plays role in unsaturated fatty acid utilization and liver metabolism. Important in chick, hog, and dog nutrition.	Microcytic hypochromic anemia in dogs, lack of coordination of gait of pigs. One of the vitamins lacking in individuals having multiple deficiencies in pellagra.	Liver Yeast Crude cane molasses Cereals Legumes Milk
Pantothenic Acid Pantothen Filtrate factor Chick anti-dermatitis factor Factor II (Member of vitamin B complex)	Beta-alanine derivative of a substituted butyryl lactone. A white solid not readily soluble in water. Commercially available as calcium salt $Ca(C_8H_{16}O_6N)_2$ which is water soluble. Stable to autoclaving, light oxidizing and reducing agents. Unstable to alkali.	Significance in human nutrition not established. Essential for certain bacteria, rats, chickens, and dogs, as well as humans. Necessary for maintaining normal adrenal activity. Thought to be one of several substances playing a role in preventing grey hair. Essential for growth and reproduction of chicks.	Dermatitis in chicks. Retarded growth and greying of hair in rats. Deficiency usually occurs along with pellagra	Yeast Liver Kidney Eggs Cane Molasses Milk Wheat germ

Choline (Member of vitamin B complex)	Hydroxyethyl trimethyl ammonium hydroxide—a colorless viscous liquid which has strong basic properties. Basic constituent of lecithin and the chloride is available commercially. The latter is a colorless crystalline hygroscopic solid—very soluble in water. Salty, bitter taste.	Essential in fat metabolism to mobilize fatty acids, supplies "labile" methyl groups.	Impairment of liver and renal functions. "Slipped tendon" of fowl.	Liver Egg yolk Brain Kidney Heart Sweet breads Yeast Cereal germs Legumes Green leafy vegetables Potatoes Milk
Vitamin C Ascorbic acid Anti-scorbutic vitamins Cevitic acid	A hexuronic acid. A white crystalline solid soluble in water with sour acid taste. Insoluble in oils. Destroyed by exposure to air, light, and alkali. Deterioration accelerated by metals such as iron and copper. Strong reducing agent. Cannot be stored in the body.	Prevents and cures scurvy. Necessary for formation and maintenance of intercellular tooth and bone structure. Prevents capillary fragility. Increases resistance to bacterial toxins and infections. Infection increases vitamin C requirement of body.	Scurvy. Dental caries. Gum infections. Slow healing of wounds. Defective formation of bones and teeth.	Citrus fruits Alfalfa Cabbage Green and red peppers Raw turnip Tomato Pineapple
Vitamin D Anti-rachitic vitamin	At least ten active vitamin D sterols are known. Vitamin E Alpha tocopherol Anti-sterility vitamin	<p>D₁ (activated 7-dihydro-cholesterol) derived mainly from animal sources. Vitamin D is fat soluble, heat stable and not readily destroyed by oxidation. Can be produced in many foodstuffs by irradiation or exposure to sunlight. Light energy activates sterils present to active vitamin D. In similar fashion sterols beneath skin are activated to form vitamin D upon exposure to ultra violet or sunlight. Activated ergosterol dissolved in vegetable oils = viosterol.</p> <p>Has chromane structure (C₂₈H₄₆O₂). Thick viscous oil-soluble in fat solvents. Heat stable and resistant to mild oxidation. Ferric salts and rancid fats destroy physiological activity. Obtained from natural sources in unsaponifiable fraction.</p>	<p>Has anti-oxidant properties. Has not been demonstrated to be effective in humans but has been shown to prevent sterility in male and female rats. Important in muscular and nervous systems.</p>	<p>No definite deficiency symptoms in humans. Has been used with success in habitual and threatened abortion as well as certain neuro-muscular disorders.</p>	<p>Wheat germ oil Corn oil Lettuce Spinach Egg yolk Meat Legume Seeds</p>

Characteristics and Functions of the Vitamins (Continued)

Factor and synonyms	Description and properties	Importance	Deficiency symptoms	Chief natural sources
Vitamin K Anti-hemorrhagic factor Coagulation vitamin	Natural product is naphthoquinone compound—oily liquid and insoluble in H ₂ O. Fat-soluble, stable to heat and reducing agents. Labile to alcoholic alkali, oxidizing agents, strong acids, and AlCl ₃ . Occurs in nature as a phytyl derivative (vitamin K ₁) in green leaves. The difarnesyl derivative (vitamin K ₂) is formed by putrefaction. A commercial synthetic 2-methyl 1,4 naphthoquinone has vitamin K activity and is called Menadiolone.	Aids in prevention of hemorrhage in newborn. Essential in promoting normal prothrombin content and clotting of blood.	Obstructive jaundice. Hemorrhagic tendency. Poor healing of wounds after post-operative conditions.	Alfalfa concentrate Spinach Cabbage Cauliflower Kale Carrot greens Tomatoes

Vitamin Unit Table

Vitamin A	1 International Unit = 1 USP Unit Activity of 0.6 micrograms* of beta-carotene
Vitamin B ₁	1 International Unit = 1 USP Unit Activity of 3.0 micrograms of crystalline thiamin chloride
Riboflavin	Quantities expressed in micrograms or milligrams
Niacin	Quantities expressed in micrograms or milligrams
Niacin amide }	
Pantothenic acid	Quantities expressed in micrograms or milligrams
Choline	Quantities expressed in milligrams
Pyridoxine	Quantities expressed in micrograms or milligrams
Vitamin C	Expressed in milligrams 1 International Unit = 1 USP Unit and is equal to activity of 0.05 milligrams of synthetic ascorbic acid.
Vitamin D (For humans and four-footed animals)	1 International Unit = 1 USP Unit Potency of 0.025 micrograms of pure Vitamin D ₂ (calciferol) made by irradiation of ergosterol.
Vitamin E	Measured in micrograms or milligrams One I.U. is the alpha tocopherol activity of 0.1 gm of the International standard solution containing 1 mg. of pure synthetic alpha tocopherol acetate.

* Note.--One microgram = 0.000001 grams.

Abbreviations

A = Vitamin A	E = Vitamin E
B = Vitamin B ₁	K = Vitamin K
C = Vitamin C	N = Nicotinic Acid or Niacin
D = Vitamin D	R = Riboflavin

Reaction indicates the type and degree of reaction of the food in the body. The relative acidity or basicity is indicated by the designation h, high, m, medium; and l, low

COMPOSITION OF FOODS

Recommended Dietary Allowances¹ (Continued)

¹ Revised 1945 Food and Nutrition Board, National Research Council.

² The allowance depends on the relative amounts of vitamin A and carotene. The allowances of the table are based on the premise that approximately two-thirds of the vitamin A value of the average diet in this country is contributed by carotene and that carotene has half or less than half the value of vitamin A.

³ For adults (except pregnant and lactating women) receiving diets supplying 2,000 calories or less, such as reducing diets, the allowances of thiamin, riboflavin, and niacin may be 1 mg., 1.5 mg., and 10 mg. respectively. The fact that figures are given for different calorie levels for thiamin, riboflavin, and niacin does not imply that we can estimate the requirement of these factors within 500 calories, but they are added merely for simplicity of calculation. Other members of the B complex also are required, though no values can be given. Foods supplying adequate thiamin, riboflavin, and niacin will tend to supply sufficient of the remaining B vitamins.

⁴ There is evidence that the male adult needs little or no iron. The allowance will be provided if the diet is satisfactory in other respects.

⁵ For persons who have no opportunity for exposure to clear sunshine and for elderly persons, the ingestion of small amounts of vitamin D may be desirable. Other adults probably have little need for vitamin D.

⁶ During the latter part of pregnancy the allowance should increase approximately 20 percent over the preceding level. The value of 2500 calories represents the allowance for pregnant, sedentary women.

⁷ Allowances for children are based on the needs for the middle year in each group (as 2, 5, 8, etc.) and are for moderate activity and for average weight at the middle year of the age group.

⁸ Needs of infants increase from month to month with size and activity. The amounts given are for approximately 6 to 8 months. The allowance in calories and the protein in grams are indicated per kilogram weight. The values should be divided by 2.2 to obtain the figures per pound weight. The dietary requirements for some of the nutrients such as protein and calcium are less if derived largely from human milk.

COMPOSITION AND VALUE OF FOODS

Compiled mainly from the publications of the U. S. Department of Agriculture.

The proportions of **protein**, **fat**, **carbohydrate** and **mineral matter** are given as percent by weight of the food named. The fuel value is stated in kilogram calories per 100 grams.

The standard daily requirement for an average adult has been accepted as 3000 calories; 75 g of protein, 0.69 g of calcium, 1.32 g of phosphorus, 0.015 g of iron.

The relative value of the food as a source of **vitamins** is shown by letters indicating the vitamins present with subscripts showing the relative abundance. Symbol **N** is used to indicate nicotinic acid and **R**, riboflavin. The best sources are indicated as rich in the particular vitamin by the subscript **r**. Other classifications are shown by the subscripts **e**, **g** and **f** for excellent, good and fair respectively.

SPECIFIC GRAVITY OF AQUEOUS SOLUTIONS

The following collections of tables gives the specific gravity, grams per liter, pounds per cubic foot, and pounds per gallon for a large number of substances in aqueous solution. The three latter quantities have been computed from the per cent of the substance in solution and the specific gravity, assuming the density of water at 4° C. as unity. The U. S. gallon, cubic foot, and pound avoirdupois equivalents were used. The degree Baumé corresponding to the specific gravity is given according to the relation,

$$\text{Bé.} = 145 - \frac{145}{\text{Sp. Gr.}}$$

The per cent by weight is indicated in every case.

The substances are arranged in alphabetical order. The specific gravity of alcohol solutions will be found in a separate group. Another table gives, with less detail, the specific gravity of solutions of many other substances.

Tables indicated by the symbol * have been computed on the basis of values for the specific gravity found in the International Critical Tables.

AQUA AMMONIA

Authority—W. C. FERGUSON

This table has been approved and adopted as a standard by the Manufacturing Chemists' Association of the United States. Specific Gravity determinations were made at 60° F., compared with water at 60° F.

From the Specific Gravities, the corresponding degrees Baumé were calculated by the following formula:

$$\text{Baumé} = \frac{140}{\text{Sp. Gr.}} - 130.$$

Baumé Hydrometers for use with this table must be graduated by the above formula, which formula should *always* be printed on the scale.

Atomic weights from F. W. Clarke's table of 1901. O = 16.

Allowance for Temperature

The coefficient of expansion for Ammonia Solutions varying with the temperature, correction must be applied according to the following table:

Corrections to be added for each degree below 60° F.			Corrections to be subtracted for each degree above 60° F.			
Degrees Baumé	40° F.	50° F.	70° F.	80° F.	90° F.	100° F.

HYDROCHLORIC ACID

Authority—W. C. FERGUSON

This table has been approved and adopted as a standard by the Manufacturing Chemists' Association of the United States.

Specific Gravity determinations were made at 60° F., compared with water at 60° F.

From the Specific Gravities, the corresponding degrees Baumé were calculated by the following formula:

$$\text{Baumé} = 145 - \frac{145}{\text{Sp. Gr.}}$$

Baumé Hydrometers for use with this table must be graduated by the above formula which formula should *always* be printed on the scale.

Atomic weights from F. W. Clarke's table of 1901. O = 16.

Allowance for Temperature

10° – 15° Bé. — 1/40° Bé. or .0002 Sp. Gr. for 1° F.
 15° – 22° Bé. — 1/30° Bé. or .0003 " " " 1° F.
 22° – 25° Bé. — 1/28° Bé. or .00035 " " " 1° F.

NITRIC ACID

Authority — W. C. FERGUSON

This table has been approved and adopted as a Standard by the Manufacturing Chemists' Association of the United States.

Specific Gravity determinations were made at 60° F., compared with water at 60° F.

From the Specific Gravities, the corresponding degrees Baumé were calculated by the following formula:

$$\text{Baumé} = 145 - \frac{145}{\text{Sp. Gr.}}$$

Baumé Hydrometers for use with this table must be graduated by the above formula, which formula should *always* be printed on the scale.

Atomic weights from F. W. Clarke's table of 1901. O = 16.

Allowance for Temperature

At 10°–20° Bé. — 1/30° Bé. or .00029 Sp. Gr. = 1° F.

20°–30° Bé. — 1/23° Bé. or .00044 " " = 1° F.

30°–40° Bé. — 1/20° Bé. or .00060 " " = 1° F.

40°–48.5° Bé. — 1/17° Bé. or .00084 " " = 1° F.

TABLES OF THE MANUFACTURING CHEMISTS' ASSOCIATION

SULFURIC ACID

Authorities—W. C. FERGUSON; H. P. TALBOT

This table has been approved and adopted as a standard by the Manufacturing Chemists' Association of the United States.

Specific Gravity determinations were made at 60° F., compared with water at 60° F.

From the Specific Gravities the corresponding degrees Baumé were calculated by the following formula:

$$\text{Baumé} = 145 - \frac{145}{\text{Sp. Gr.}}$$

Baumé Hydrometers for use with this table must be graduated by the above formula, which formula should always be printed on the scale.

$$66^{\circ} \text{ Baumé} = \text{Sp. Gr. } 1.8354.$$

1 cu. ft. water at 60° F. weighs 62.37 lbs. av.

Atomic weights from F. W. Clarke's table of 1901. O = 16.

H₂SO₄ = 100 per cent.

	H ₂ SO ₄	O. V.	60°
O. V.	93.19	100.00	119.98
60°	77.67	83.35	100.00
50°	62.18	66.72	80.06

Acids stronger than 66° Bé. should have their percentage compositions determined by chemical analysis.
